1.2 About this manual

Objective and contents This manual describes the CPU 013-CCF0R00 of the System SLIO from VIPA. It contains a description of the construction, project implementation and usage.

Product	Order number	as of state:		
		CPU-HW	CPU-FW	
CPU 013C	013-CCF0R00	01	V2.2.8	
Target audience	The manual is targeted at users who have a back	ground in automatior	n technology.	
Structure of the manual	f the manual The manual consists of chapters. Every chapter provides a self-contained description specific topic.		ned description of a	
Guide to the document	The following guides are available in the manual			
	An overall table of contents at the beginning	of the manual		
	 References with page numbers 			
	-			
Availability	The manual is available in:			
	 printed form, on paper in electronic form as PDF-file (Adobe Acrobat Reader) 			
Icons Headings Important passages in the text are highlighted by following ic		following icons and h	neadings:	
	DANGER! Immediate or likely danger. Personal i	ijury is possible.		

CAUTION!

Damages to property is likely if these warnings are not heeded.

Supplementary information and useful tips.

1.3 Safety information

Applications conforming with specifications

The system is constructed and produced for:

- communication and process control
- general control and automation tasks
- industrial applications
- operation within the environmental conditions specified in the technical data
- installation into a cubicle

DANGER!

This device is not certified for applications in

in explosive environments (EX-zone)

Documentation

The manual must be available to all personnel in the

- project design department
- installation department
- commissioning
- operation

CAUTION!

The following conditions must be met before using or commissioning the components described in this manual:

- Hardware modifications to the process control system should only be carried out when the system has been disconnected from power!
- Installation and hardware modifications only by properly trained personnel.
- The national rules and regulations of the respective country must be satisfied (installation, safety, EMC ...)

Disposal

National rules and regulations apply to the disposal of the unit!

Safety information for users

2 Basics and mounting

2.1 Safety information for users

Handling of electrostatic sensitive modules VIPA modules make use of highly integrated components in MOS-Technology. These components are extremely sensitive to over-voltages that can occur during electrostatic discharges. The following symbol is attached to modules that can be destroyed by electrostatic discharges.

The Symbol is located on the module, the module rack or on packing material and it indicates the presence of electrostatic sensitive equipment. It is possible that electrostatic sensitive equipment is destroyed by energies and voltages that are far less than the human threshold of perception. These voltages can occur where persons do not discharge themselves before handling electrostatic sensitive modules and they can damage components thereby, causing the module to become inoperable or unusable. Modules that have been damaged by electrostatic discharges can fail after a temperature change, mechanical shock or changes in the electrical load. Only the consequent implementation of protection devices and meticulous attention to the applicable rules and regulations for handling the respective equipment can prevent failures of electrostatic sensitive modules.

Shipping of modules

Modules must be shipped in the original packing material.

Measurements and alterations on electrostatic sensitive modules When you are conducting measurements on electrostatic sensitive modules you should take the following precautions:

- Floating instruments must be discharged before use.
- Instruments must be grounded.

Modifying electrostatic sensitive modules you should only use soldering irons with grounded tips.

CAUTION!

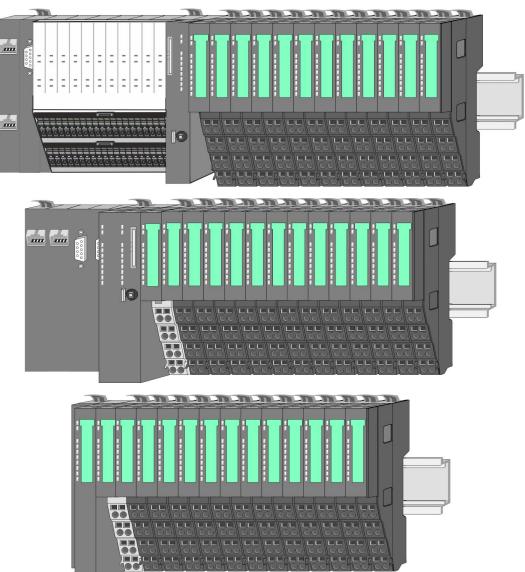

Personnel and instruments should be grounded when working on electrostatic sensitive modules.

System conception > Overview

2.2 System conception

2.2.1 Overview

System SLIO is a modular automation system for assembly on a 35mm mounting rail. By means of the peripheral modules with 2, 4 or 8 channels this system may properly be adapted matching to your automation tasks. The wiring complexity is low, because the supply of the DC 24V power section is integrated to the backplane bus and defective modules may be replaced with standing wiring. By deployment of the power modules in contrasting colors within the system, further isolated areas may be defined for the DC 24V power section supply, respectively the electronic power supply may be extended with 2A.

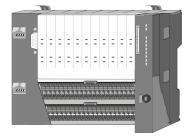

2.2.2 Components

- CPU (head module)
- Bus coupler (head module)
- Line extension
- Periphery modules
- Accessories

Only modules of VIPA may be combined. A mixed operation with thirdparty modules is not allowed!

CPU 01xC

With this CPU 01xC, the CPU electronic, input/output components and power supply are integrated to one casing. In addition, up to 64 periphery modules of the System SLIO can be connected to the backplane bus. As head module via the integrated power supply CPU electronic and the I/O components are power supplied as well as the electronic of the connected periphery modules. To connect the power supply of the I/O components and for DC 24V power supply of via backplane bus connected peripheral modules, the CPU has removable connectors. By installing of up to 64 periphery modules at the backplane bus, these are electrically connected, this means these are assigned to the backplane bus, the electronic modules are power supplied and each periphery module is connected to the DC 24V power section supply.

CPU 01x

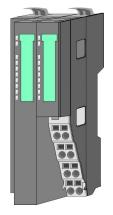

With this CPU 01x, the CPU electronic and power supply are integrated to one casing. As head module, via the integrated power module for power supply, CPU electronic and the electronic of the connected periphery modules are supplied. The DC 24 power section supply for the linked periphery modules is established via a further connection of the power module. By installing of up to 64 periphery modules at the backplane bus, these are electrically connected, this means these are assigned to the backplane bus, the electronic modules are power supplied and each periphery module is connected to the DC 24V power section supply.

CAUTION!

CPU part and power module may not be separated! Here you may only exchange the electronic module!

Bus coupler

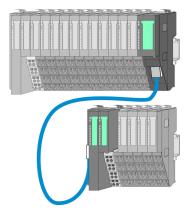

With a bus coupler bus interface and power module is integrated to one casing. With the bus interface you get access to a subordinated bus system. As head module, via the integrated power module for power supply, bus interface and the electronic of the connected periphery modules are supplied. The DC 24 power section supply for the linked periphery modules is established via a further connection of the power module. By installing of up to 64 periphery modules at the bus coupler, these are electrically connected, this means these are assigned to the backplane bus, the electronic modules are power supplied and each periphery module is connected to the DC 24V power section supply.

System conception > Components

CAUTION! Bus interface and power module may not be separated! Here you may only exchange the electronic module!

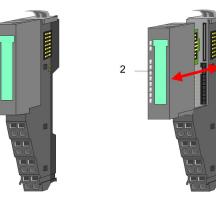

Line extension

In the System SLIO there is the possibility to place up to 64 modules in on line. By means of the line extension you can divide this line into several lines. Here you have to place a line extension master at each end of a line and the subsequent line has to start with a line extension slave. Master and slave are to be connected via a special connecting cable. In this way, you can divide a line on up to 5 lines. For each line extension the maximum number of pluggable modules at the System SLIO bus is decreased by 1. To use the line extension no special configuration is required.

Periphery modules

Each periphery module consists of a *terminal* and an *electronic module*.

- 1 Terminal module
- 2 Electronic module

Terminal module

The *terminal* module serves to carry the electronic module, contains the backplane bus with power supply for the electronic, the DC 24V power section supply and the staircase-shaped terminal for wiring. Additionally the terminal module has a locking system for fixing at a mounting rail. By means of this locking system your SLIO system may be assembled outside of your switchgear cabinet to be later mounted there as whole system.

System conception > Accessories

Electronic module

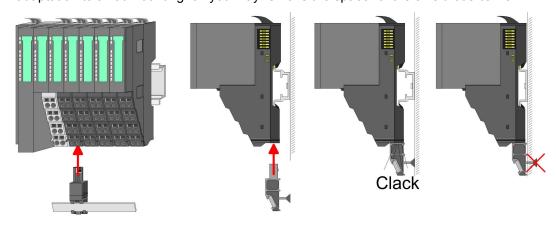

The functionality of a SLIO periphery module is defined by the *electronic* module, which is mounted to the terminal module by a sliding mechanism. With an error the defective module may be exchanged for a functional module with standing installation. At the front side there are LEDs for status indication. For simple wiring each module shows a corresponding connection diagram at the front and at the side.

2.2.3 Accessories Shield bus carrier

The shield bus carrier (order no.: 000-0AB00) serves to carry the shield bus (10mm x 3mm) to connect cable shields. Shield bus carriers, shield bus and shield fixings are not in the scope of delivery. They are only available as accessories. The shield bus carrier is mounted underneath the terminal of the terminal module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.

Bus cover

With each head module, to protect the backplane bus connectors, there is a mounted bus cover in the scope of delivery. You have to remove the bus cover of the head module before mounting a System SLIO module. For the protection of the backplane bus connector you always have to mount the bus cover at the last module of your system again. The bus cover has the order no. 000-0AA00.

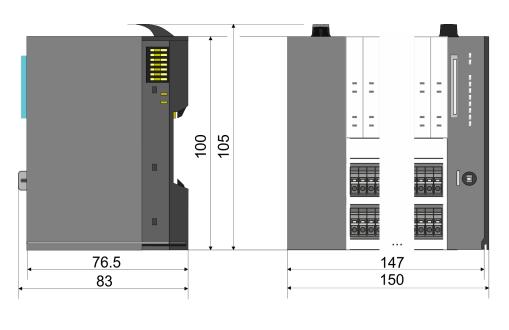

Coding pins

There is the possibility to fix the assignment of electronic and terminal module. Here coding pins (order number 000-0AC00) from VIPA can be used. The coding pin consists of a coding jack and a coding plug. By combining electronic and terminal module with coding pin, the coding jack remains in the electronic module and the coding plug in the terminal module. This ensures that after replacing the electronics module just another electronic module can be plugged with the same encoding.

Mounting > Mounting CPU 01xC

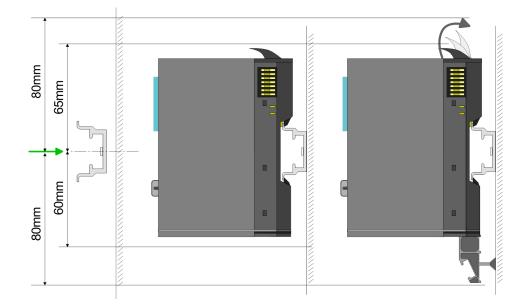

2.4 Mounting

2.4.1 Mounting CPU 01xC

There are locking lever at the top side of the CPU. For mounting and demounting these locking lever are to be turned upwards until these engage. Place the CPU at the mounting rail. The CPU is fixed to the mounting rail by pushing downward the locking levers. The CPU is directly mounted at a mounting rail. Up to 64 modules may be mounted. The electronic and power section supply are connected via the backplane bus. Please consider here that the sum current of the electronic power supply does not exceed the maximum value of 1A. By means of the power module 007-1AB10 the current of the electronic power supply may be expanded accordingly.

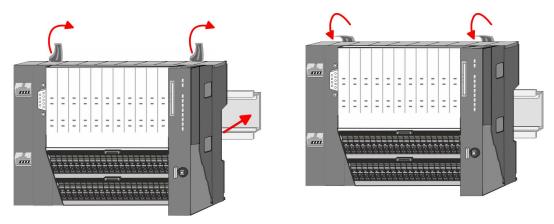

Proceeding

1. Mount the mounting rail! Please consider that a clearance from the middle of the mounting rail of at least 80mm above and 60mm below, respectively 80mm by deployment of shield bus carriers, exist.

Basics and mounting

Mounting > Mounting CPU 01xC

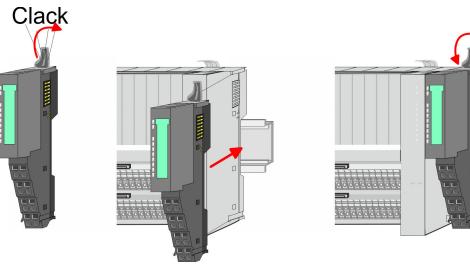

- **2.** Turn the locking lever upwards, place the CPU at the mounting rail and turn the lever downward.
 - ⇒ If you want to use the CPU without periphery modules, the mounting is now complete.

Mounting periphery modules

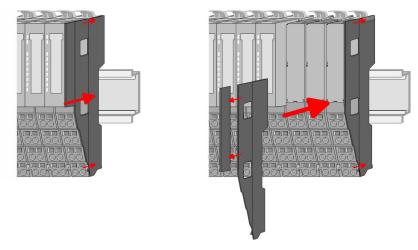

1. Before mounting the periphery modules you have to remove the bus cover at the right side of the CPU by pulling it forward. Keep the cover for later mounting.

2. Mount the periphery modules you want.

Wiring > Wiring CPU 01xC

3. After mounting the whole system, to protect the backplane bus connectors at the last module you have to mount the bus cover, now. If the last module is a clamp module, for adaptation the upper part of the bus cover is to be removed.

2.5 Wiring 2.5.1 Wiring CPU 01xC CPU connector

For wiring the CPU 01xC has removable connectors. With the wiring of the connectors a "push-in" spring-clip technique is used. This allows a quick and easy connection of your signal and supply lines. The clamping off takes place by means of a screwdriver.

 Stripping length
 10mm

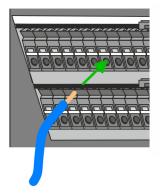

Use for wiring rigid wires respectively use wire sleeves. When using stranded wires you have to press the release button with a screwdriver during the wiring.

Wiring procedure

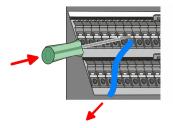

- 1 Labeling on the casing
- 2 Pin no. at the connector
- 3 Release button
- 4 Connection hole for wire

Insert wire

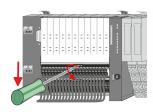

Remove wire

Remove connectors (module replacement)

The wiring happens without a tool.

- Determine according to the casing labelling the connection position and insert through the round connection hole of the according contact your prepared wire until it stops, so that it is fixed.
 - ⇒ By pushing the contact spring opens, thus ensuring the necessary contact pressure.

The wire is to be removed by means of a screwdriver with 2.5mm blade width.

- **1.** Press with your screwdriver vertically at the release button.
 - \Rightarrow The contact spring releases the wire.
- **2.** Pull the wire from the round hole.

By means of a screwdriver there is the possibility to remove the connectors e.g. for module exchange with a fix wiring. For this each connector has a release lever centrally on its top side. Unlocking takes place by the following proceeding:

1. Remove connector:

Push your screwdriver horizontally into the slot between connector and release lever, until it stops.

- 2. Push the screwdriver down:
 - \Rightarrow The connector is unlocked and can be removed by turning downwards.

CAUTION!

Via wrong operation such as pressing, the screwdriver upward the release lever may be damaged.

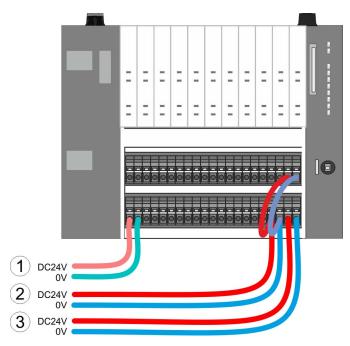

3. Plug connector:

The connector is plugged by setting it at the bottom line and engage with a with a slight twist upwards into the release lever.

Basics and mounting

Wiring > Wiring CPU 01xC

Standard wiring

- (1) DC 24V for electronic section supply of the CPU, the internal I/Os and SLIO bus
- (2) DC 24V for power section supply integrated I/Os
- (3) DC 24V for power section supply SLIO bus

The electronic power section supply is internally protected against higher voltage by fuse. The fuse is located inside the CPU and can not be changed by the user.

Fusing

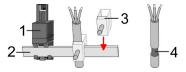

- It is recommended to externally protect the electronic power supply for CPU and SLIO bus with a 3A fuse (fast) respectively by a line circuit breaker 3A characteristics Z.
- The power section supply of the internal I/Os is to be externally protected with a 6A fuse (fast) respectively by a line circuit breaker 6A characteristics Z!
- The power section supply of the SLIO bus is to be externally protected with a 6A fuse (fast) respectively by a line circuit breaker 6A characteristics Z! For UL-compliant operation, use a fuse that is UL listed or "UL-recognized".

After PowerON of the System SLIO the LEDs RUN respectively MF get on so far as the sum current does not exceed 1A. With a sum current greater than 1A the LEDs may not be activated. Here the power module with the order number 007-1AB10 is to be placed between the peripheral modules.

Shield attachment

State of the electronic

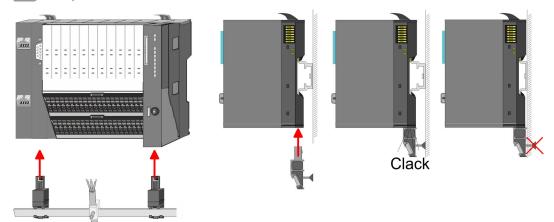

power supply via LEDs

- 1 Shield bus carrier
- 2 Shield bus (10mm x 3mm)
- 3 Shield clamp
- 4 Cable shield

To attach the shield the mounting of shield bus carriers are necessary. The shield bus carrier (available as accessory) serves to carry the shield bus to connect cable shields.

- **1.** Each System SLIO module has a carrier hole for the shield bus carrier. Push the shield bus carrier, until they engage into the module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.
- 2. Put your shield bus into the shield bus carrier.

3. Attach the cables with the accordingly stripped cable screen and fix it by the shield clamp with the shield bus.

2.5.2 Wiring periphery modules

Terminal module terminals

Do not connect hazardous voltages!

If this is not explicitly stated in the corresponding module description, hazardous voltages are not allowed to be connected to the corresponding terminal module!

With wiring the terminal modules, terminals with spring clamp technology are used for wiring. The spring clamp technology allows quick and easy connection of your signal and supply lines. In contrast to screw terminal connections this type of connection is vibration proof.

Data

 U_{max}
 240V AC / 30V DC

 I_{max}
 10A

 Cross section
 0.08 ... 1.5mm² (AWG 28 ... 16)

 Stripping length
 10mm

Wiring procedure

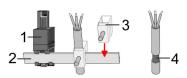

- 1 Pin number at the connector
- 2 Opening for screwdriver
- 3 Connection hole for wire

Wiring > Wiring periphery modules

- **1.** Insert a suited screwdriver at an angel into the square opening as shown. Press and hold the screwdriver in the opposite direction to open the contact spring.
- **2.** Insert the stripped end of wire into the round opening. You can use wires with a cross section of 0.08mm² up to 1.5mm²
- **3.** By removing the screwdriver, the wire is securely fixed via the spring contact to the terminal.

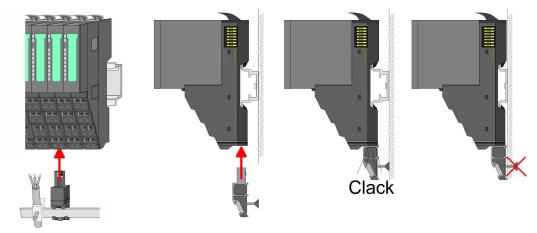

Shield attachment

- 1 Shield bus carrier
- 2 Shield bus (10mm x 3mm)
- 3 Shield clamp
- 4 Cable shield

To attach the shield the mounting of shield bus carriers are necessary. The shield bus carrier (available as accessory) serves to carry the shield bus to connect cable shields.

- **1.** Each System SLIO module has a carrier hole for the shield bus carrier. Push the shield bus carrier, until they engage into the module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.
- 2. Put your shield bus into the shield bus carrier.

3. Attach the cables with the accordingly stripped cable screen and fix it by the shield clamp with the shield bus.

2.5.3 Wiring power modules

Terminal module terminals

Power modules are either integrated to the head module or may be installed between the periphery modules. With power modules, terminals with spring clamp technology are used for wiring. The spring clamp technology allows quick and easy connection of your signal and supply lines. In contrast to screw terminal connections this type of connection is vibration proof.

Pos.	Function	Туре	Description
1			not connected
2	DC 24V	I	DC 24V for power section supply
3	0V	I	GND for power section supply
4	Sys DC 24V	I	DC 24V for electronic section supply
5			not connected
6	DC 24V	I	DC 24V for power section supply
7	0V	I	GND for power section supply
8	Sys 0V	I	GND for electronic section supply

I: Input

CAUTION!

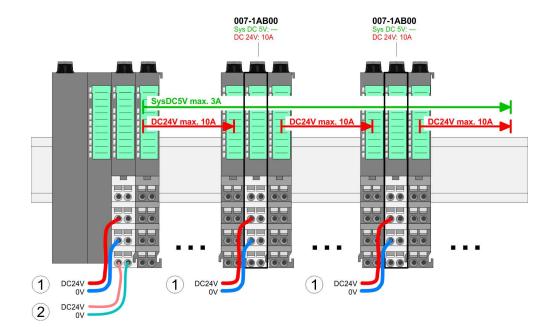

Since the power section supply is not internally protected, it is to be externally protected with a fuse, which corresponds to the maximum current. This means max. 10A is to be protected by a 10A fuse (fast) respectively by a line circuit breaker 10A characteristics Z!

The electronic power section supply is internally protected against higher voltage by fuse. The fuse is within the power module. If the fuse releases, its electronic module must be exchanged!

Fusing	 The power section supply is to be externally protected with a fuse, which corresponds to the maximum current. This means max. 10A is to be protected with a 10A fuse (fast) respectively by a line circuit breaker 10A characteristics Z! It is recommended to externally protect the electronic power supply for head modules 	
	and I/O area with a 2A fuse (fast) respectively by a line circuit breaker 2A characteris- tics Z.	
	The electronic power supply for the I/O area of the power module 007-1AB10 should also be externally protected with a 1A fuse (fast) respectively by a line circuit breaker 1A characteristics Z.	
State of the electronic power supply via LEDs	After PowerON of the System SLIO the LEDs RUN respectively MF get on so far as th sum current does not exceed 1A. With a sum current greater than 1A the LEDs may n be activated. Here the power module with the order number 007-1AB10 is to be placed between the peripheral modules.	
Deployment of the power modules	If the 10A for the power section supply is no longer sufficient, you may use the power module from VIPA with the order number 007-1AB00. So you have also the possibility to define isolated groups.	
	The power module with the order number 007-1AB10 is to be used if the 3A for the electronic power supply at the backplane bus is no longer sufficient. Additionally you get an isolated group for the DC 24V power section supply with max. 4A.	
	By placing the power module 007-1AB10 at the following backplane bus modules	

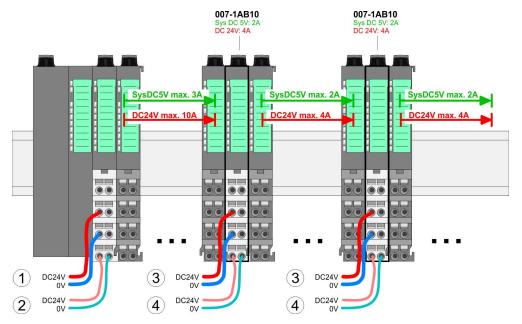

By placing the power module 007-1AB10 at the following backplane bus modules may be placed with a sum current of max. 2A. Afterwards a power module is to be placed again. To secure the power supply, the power modules may be mixed used.

Power module 007-1AB00

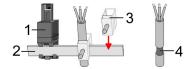

Wiring > Wiring power modules

Power module 007-1AB10

- (1) DC 24V for power section supply I/O area (max. 10A)
- (2) DC 24V for electronic power supply bus coupler and I/O area
 (3) DC 24V for power section supply I/O area (max. 4A)
- (4) DC 24V for electronic power supply I/O area

Shield attachment

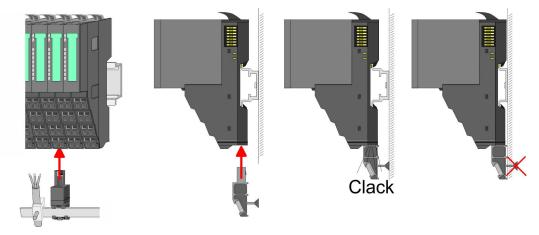

- Shield bus carrier 1
- Shield bus (10mm x 3mm) 2
- Shield clamp 3
- 4 Cable shield

To attach the shield the mounting of shield bus carriers are necessary. The shield bus carrier (available as accessory) serves to carry the shield bus to connect cable shields.

- 1. Each System SLIO module has a carrier hole for the shield bus carrier. Push the shield bus carrier, until they engage into the module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.
- 2. Put your shield bus into the shield bus carrier.

Basics and mounting

Wiring > Wiring power modules

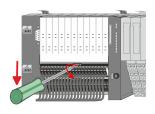

3. Attach the cables with the accordingly stripped cable screen and fix it by the shield clamp with the shield bus.

2.6 Demounting

2.6.1 Demounting CPU 01xC

Proceeding

Remove connector

3. Push the screwdriver down

Power-off your system.
 Remove connector:

lever, until it stops.

 \Rightarrow The connector is unlocked and can be removed by turning downwards.

By means of a screwdriver there is the possibility to remove the connectors e.g. for

on its top side. Unlocking takes place by the following proceeding:

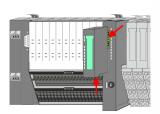

module exchange with a fix wiring. For this each connector has a release lever centrally

Push your screwdriver horizontally into the slot between connector and release

CAUTION! Via wrong operation such as pressing, the screwdriver upward the release lever may be damaged.

CPU replacement

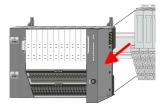

1.

For demounting and exchange of a (head) module or a group of modules, due to mounting reasons you always have to remove the electronic module <u>right</u> beside. After mounting it may be plugged again.

Press the unlocking lever at the lower side of the just mounted right module and pull it forward.

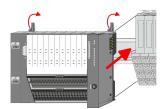

2. Turn all the locking lever of the CPU to be exchanged upwards.

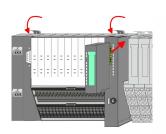

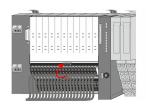

- 3. Pull the CPU forward.
- **<u>4.</u>** For mounting turn all the locking lever of the CPU to be mounted upwards.

Demounting > Demounting CPU 01xC

Plug connector

- **5.** To mount the CPU put it to the periphery module and push it, guided by the stripes, to the mounting rail.
- **6.** Turn all the locking lever downward, again.
- **7.** Plug again the electronic module, which you have removed before. For installation plug the electronic module guided by the strips at the lower side until this engages to the terminal module.

- Put the connector on the bottom edge and push it, as shown in the figure, with a rotation upwards into the release lever until it engages.
 - \Rightarrow Now you can bring your system back into operation.

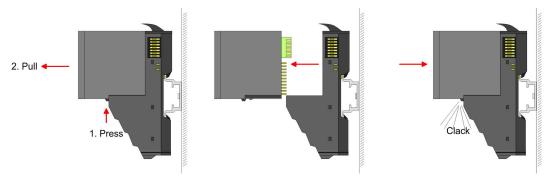

Demounting > Demounting periphery modules

2.6.2 Demounting periphery modules

Proceeding

Exchange of an electronic module

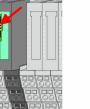

- 2. For the exchange of a electronic module, the electronic module may be pulled forward after pressing the unlocking lever at the lower side of the module.
- 3. For installation plug the new electronic module guided by the strips at the lower side until this engages to the terminal module.
 - \Rightarrow Now you can bring your system back into operation.

Exchange of a periphery module

- 1. Power-off your system.

3.

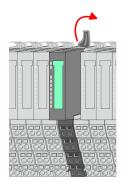

2. Remove if exists the wiring of the module.

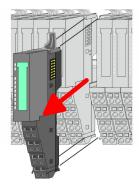

For demounting and exchange of a (head) module or a group of modules, due to mounting reasons you always have to remove the electronic module right beside. After mounting it may be plugged again.

Press the unlocking lever at the lower side of the just mounted right module and pull it forward.

4. Turn the locking lever of the module to be exchanged upwards.

Demounting > Demounting periphery modules

- 5. Pull the module.
- **6.** For mounting turn the locking lever of the module to be mounted upwards.

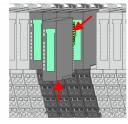

7. To mount the module put it to the gap between the both modules and push it, guided by the stripes at both sides, to the mounting rail.

9. Plug again the electronic module, which you have removed before.

⇒ Now you can bring your system back into operation.

8. Turn the locking lever downward, again.

- Exchange of a module group

1. Power-off your system.

10. Wire your module.

2. Remove if exists the wiring of the module group.

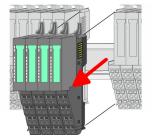

For demounting and exchange of a (head) module or a group of modules, due to mounting reasons you always have to remove the electronic module <u>right</u> beside. After mounting it may be plugged again.

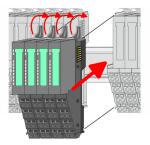

Press the unlocking lever at the lower side of the just mounted right module near the module group and pull it forward.

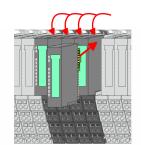

4. Turn all the locking lever of the module group to be exchanged upwards.

Basics and mounting

Trouble shooting - LEDs

- **5.** Pull the module group forward.
- **6.** For mounting turn all the locking lever of the module group to be mounted upwards.
- **7.** To mount the module group put it to the gap between the both modules and push it, guided by the stripes at both sides, to the mounting rail.
- 8. Turn all the locking lever downward, again.
- **9.** Plug again the electronic module, which you have removed before.
- **10.** Wire your module group.
 - \Rightarrow Now you can bring your system back into operation.

2.7 Trouble shooting - LEDs

General

Each module has the LEDs RUN and MF on its front side. Errors or incorrect modules may be located by means of these LEDs.

In the following illustrations flashing LEDs are marked by $\dot{\heartsuit}.$

Sum current of the electronic power supply exceeded

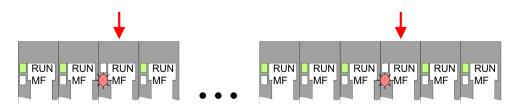

Behaviour: After PowerON the RUN LED of each module is off and the MF LED of each module is sporadically on.

Reason: The maximum current for the electronic power supply is exceeded.

Remedy: As soon as the sum current of the electronic power supply is exceeded, always place the power module 007-1AB10. *Chapter 2.5.3 Wiring power modules' on page 25*

Error in configuration

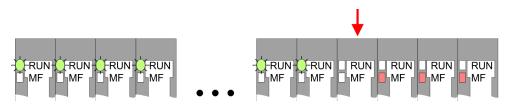

Behaviour: After PowerON the MF LED of one module respectively more modules flashes. The RUN LED remains off.

Trouble shooting - LEDs

Reason: At this position a module is placed, which does not correspond to the configured module.

Remedy: Match configuration and hardware structure.

Module failure

Behaviour: After PowerON all of the RUN LEDs up to the defective module are flashing. With all following modules the MF LED is on and the RUN LED is off.

Reason: The module on the right of the flashing modules is defective.

Remedy: Replace the defective module.

Installation guidelines

2.8 Installation guidelines

General	The installation guidelines contain information about the interference free deployment of a PLC system. There is the description of the ways, interference may occur in your PLC, how you can make sure the electromagnetic compatibility (EMC), and how you manage the isolation.
What does EMC mean?	Electromagnetic compatibility (EMC) means the ability of an electrical device, to function error free in an electromagnetic environment without being interfered respectively without interfering the environment.
	The components of VIPA are developed for the deployment in industrial environments and meets high demands on the EMC. Nevertheless you should project an EMC planning before installing the components and take conceivable interference causes into account.
Possible interference	Electromagnetic interferences may interfere your control via different ways:
causes	 Electromagnetic fields (RF coupling) Magnetic fields with power frequency Bus system Power supply Protected earth conductor
	Depending on the spreading medium (lead bound or lead free) and the distance to the interference cause, interferences to your control occur by means of different coupling mechanisms.
	There are:
	 galvanic coupling capacitive coupling inductive coupling radiant coupling
Basic rules for EMC	In the most times it is enough to take care of some elementary rules to guarantee the EMC. Please regard the following basic rules when installing your PLC.
	Take care of a correct area-wide grounding of the inactive metal parts when installing your components.
	 Install a central connection between the ground and the protected earth conductor system. Connect all inactive metal extensive and impedance-low. Please try not to use aluminium parts. Aluminium is easily oxidizing and is therefore less suitable for grounding. When cabling, take care of the correct line routing. Organize your cabling in line groups (high voltage, current supply, signal and data lines). Always lay your high voltage lines and signal respectively data lines in separate channels or bundles. Route the signal and data lines as near as possible beside ground areas (e.g. suspension bars, metal rails, tin cabinet).

	Proof the	correct	fixing	of the	lead	isolation.
--	-----------	---------	--------	--------	------	------------

- Data lines must be laid isolated.
- Analog lines must be laid isolated. When transmitting signals with small amplitudes the one sided laying of the isolation may be favourable.
- Lay the line isolation extensively on an isolation/protected earth conductor rail directly after the cabinet entry and fix the isolation with cable clamps.
- Make sure that the isolation/protected earth conductor rail is connected impedance-low with the cabinet.
- Use metallic or metallised plug cases for isolated data lines.
- In special use cases you should appoint special EMC actions.
 - Consider to wire all inductivities with erase links.
 - Please consider luminescent lamps can influence signal lines.
- Create a homogeneous reference potential and ground all electrical operating supplies when possible.
 - Please take care for the targeted employment of the grounding actions. The grounding of the PLC serves for protection and functionality activity.
 - Connect installation parts and cabinets with your PLC in star topology with the isolation/protected earth conductor system. So you avoid ground loops.
 - If there are potential differences between installation parts and cabinets, lay sufficiently dimensioned potential compensation lines.

Isolation of conductors Electrical, magnetically and electromagnetic interference fields are weakened by means of an isolation, one talks of absorption. Via the isolation rail, that is connected conductive with the rack, interference currents are shunt via cable isolation to the ground. Here you have to make sure, that the connection to the protected earth conductor is impedancelow, because otherwise the interference currents may appear as interference cause.

When isolating cables you have to regard the following:

- If possible, use only cables with isolation tangle.
- The hiding power of the isolation should be higher than 80%.
- Normally you should always lay the isolation of cables on both sides. Only by means of the both-sided connection of the isolation you achieve high quality interference suppression in the higher frequency area. Only as exception you may also lay the isolation one-sided. Then you only achieve the absorption of the lower frequencies. A one-sided isolation connection may be convenient, if:
 - the conduction of a potential compensating line is not possible.
 - analog signals (some mV respectively µA) are transferred.
 - foil isolations (static isolations) are used.
- With data lines always use metallic or metallised plugs for serial couplings. Fix the isolation of the data line at the plug rack. Do not lay the isolation on the PIN 1 of the plug bar!
- At stationary operation it is convenient to strip the insulated cable interruption free and lay it on the isolation/protected earth conductor line.
- To fix the isolation tangles use cable clamps out of metal. The clamps must clasp the isolation extensively and have well contact.
- Lay the isolation on an isolation rail directly after the entry of the cable in the cabinet. Lead the isolation further on to your PLC and don't lay it on there again!

Please regard at installation!

At potential differences between the grounding points, there may be a compensation current via the isolation connected at both sides.

Remedy: Potential compensation line

Properties

3 Hardware description

3.1 **Properties**

CPU 013-CCF0R00

SPEED7 technology integrated

- Programmable via VIPA SPEED7 Studio or Siemens SIMATIC Manager
- Integrated work memory 64kbyte (32kbyte code, 32kbyte data)
- Work memory expandable up to 128kbyte (64kbyte code, 64kbyte data)
- 128kbyte load memory integrated
- Slot for external storage media (lockable)
- Status LEDs for operating state and diagnostics
- X1/X2: Ethernet PG/OP channel (switch) for active and passive communication integrated
- X3: MPI(PB) interface: MPI interface with via VSC unlock able field bus functions
- Integrated Digital I/Os: DI 16xDC24V; DO 12xDC24V, 0,5A
- Integrated Analog Input : AI 2x12Bit (single ended)
- 4 channels for counter, frequency measurement and 2 channels for pulse width modulation
- Pulse Train via SFB 49 (PULSE)
- up to 64 SLIO modules placeable
- I/O address area digital/analog 2048byte
- 512 timer/counter, 8192 flag byte

Ordering data

- 9 Backplane bus
- 10 Operating mode switch CPU

X1/X2: Ethernet PG/OP	8pin RJ45 jack:					
channel	 The RJ45 jack serves as interface to the Ethernet PG/OP channel. This interface allows you to program respectively remote control your CPU and to access the internal web server. Configurable connections are possible. The connection happens via an integrated 2-port switch DHCP respectivle the assignment of the network configuration by specifying a DHCP server is supported. Default diagnostic addresses: 2025 2040 For online access to the CPU via Ethernet PG/OP channel, you have to assign IP address parameters to this. Chapter 4.6 'Hardware configuration - Ethernet PG/OP channel' on page 68 					
	Chapter 7 'Deployment PG/OP communication - productive' on page 160					
X3: MPI(PtP) interface	9pin SubD jack: (isolated)					
	The interface supports the following functionalities, which are switch able:					
	MPI (default / after overall reset) The MPI interface serves for the connection between programming unit and CPU. By means of this the project engineering and programming happens. In addition MPI serves for communication between several CPUs or between HMIs and CPU. Standard setting is MPI address 2.					
	 PtP The RS485 interface can be switched to PtP functionality & <i>Chapter 4.8 'Setting VIPA specific CPU parameters' on page 74</i>. Using the <i>PtP</i> functionality the RS485 interface is allowed to connect via serial point-to-point connection to different source res. target systems. The following protocols are supported: ASCII STX/ETX 3964R USS Modbus master (ASCII, RTU) PROFIBUS DP (option) The PROFIBUS functionality of this interface can be activated by configuring the sub module X1 <i>'MPI/DP'</i> of the CPU in the hardware configuration. & <i>Chapter 8 'Option: Deployment PROFIBUS communication' on page 175</i> 					
	To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a VSC storage media from VIPA. By plugging the VSC storage card and then an overall reset the according functionality is activated. & Chapter 4.15 'Deploy- ment storage media - VSD, VSC' on page 88

X5: Electronic power supply

The CPU has an integrated power supply. The power supply has to be provided with DC 24V. Via the power supply not only the internal electronic of the CPU is provided with voltage, but also the electronic from the integrated IO modules and the sensor output. The power supply is protected against polarity inversion and over current.

3.2.3 Memory management

General

The CPU has an integrated memory. Information about the capacity of the memory may be found at the front of the CPU. The memory is divided into the following parts:

- Load memory 128kbyte
- Code memory (50% of the work memory)
- Data memory (50% of the work memory)
- Work memory 64kbyte
 - There is the possibility to extend the work memory to its maximum capacity 128kbyte by means of a VSC.

3.2.4 Slot for storage media

Overview

In this slot you can insert the following storage media:

- VSD VIPA SD-Card
 - External memory card for programs and firmware.
- VSC VIPASetCard
 - External memory card (VSD) for programs and firmware with the possibility to unlock optional functions like work memory and field bus interfaces.

 - To activate the corresponding card is to be installed and a Overall reset is to be established. ♦ Chapter 4.12 'Overall reset' on page 85

A list of the currently available VSD respectively VSC can be found at www.vipa.com.

3.2.5 Buffering mechanisms

The SLIO CPU has a capacitor-based mechanism to buffer the internal clock in case of power failure for max. 30 days. With PowerOFF the content of the RAM is automatically stored in the Flash (NVRAM).

CAUTION!

Please connect the CPU for approximately 1 hour to the power supply, so that the internal buffering mechanism is loaded accordingly.

In case of failure of the buffer mechanism Date and Time 01.09.2009 00:00:00 set. Additionally, you receive a diagnostics message. *Chapter 4.19 'Diagnostic entries' on page 94*

3.2.6 Operating mode switch

General

- With the operating mode switch you may switch the CPU between STOP and RUN.
 - During the transition from STOP to RUN the operating mode START-UP is driven by the CPU.
 - Placing the switch to MR (Memory Reset), you request an overall reset with following load from memory card, if a project there exists.

3.2.7 LEDs

CPU part

RN	ST	SF	FC	SD	Description		
green	yellow	red	yellow	yellow			
Boot-up afte	Boot-up after PowerON - as soon as the CPU is supplied with 5V, the green PW-LED (Power) is on.						
	Х	flickers			Firmware is loaded.		
					Initialization: Phase 1		
					Initialization: Phase 2		
					Initialization: Phase 3		
					Initialization: Phase 4		
Operation							
		Х	Х	Х	CPU is in STOP state.		
		Х	Х	Х	CPU is in start-up state.		
2Hz					During the start-up (OB 100) the RUN LED blinks for at least 3s.		
	<mark>/</mark> 10Hz	х	х	х	Activation of a new hardware configuration		
			Х	Х	CPU is in state RUN without error.		
х	Х		Х	Х	There is a system fault. More information can be found in the diagnostics buffer of the CPU.		
Х	Х	Х		Х	Variables are forced.		
Х	х	Х	Х		Accessing the memory card.		
Х	<mark>/</mark> 10Hz	х	х	х	Configuration is loaded.		

Structure > LEDs

RN	ST	SF	FC	SD	Description

Ethernet PG/OP channel

L/A	S	Description
(Link/Activity)	(Speed)	
green	green	
	Х	The Ethernet PG/OP channel is physically connected to Ethernet.
	Х	There is no physical connection.
	Х	Shows Ethernet activity.
flickers		
	•	The Ethernet interface of the Ethernet PG/OP channel has a transfer rate of 100Mbit.
•		The Ethernet interface of the Ethernet PG/OP channel has a transfer rate of 10Mbit.
not relevant: X		

LEDs PROFIBUS

Dependent on the mode of operation the LEDs show information about the state of operation of the PROFIBUS part according to the following pattern:

Structure > LEDs

Master operation

DE	BF	Description
(Data Exchange)	(bus error)	
green	red 📃	
		Master has no project, this means the interface is deactivated respectively the master configured without slaves with no errors.
ZHz		CPU is in STOP state, the master is in "clear" state. All the slaves are in DE and the outputs are of the slaves are disabled.
		CPU is in RUN state, the master is in "operate" state. All the slaves are in DE. The outputs are enabled.
•	ZHz	CPU is in RUN state, at least 1 slave is missing and at least 1 slave is in DE.
ZHz	ZHz	CPU is in STOP state, the master is in "clear" state. At least 1 slave is missing and 1 slave is in DE.
		PROFIBUS is interrupted (no communication possible)
	ZHz	At least 1 slave is missing and no slave is in DE.
X	ZHz	At least 1 slave is not in DE.
not relevant: X		

Slave operation

DE	BF	Description
(Data Exchange)	(bus error)	
green	red 📕	
		Slave has no configuration.
		There is a bus error.
		Slave exchanges data with the master.
2Hz		Slave CPU is in state STOP.
•		Slave exchanges data with the master. Slave CPU is in state RUN.

4 Deployment CPU 013-CCF0R00

4.1 Assembly

	Information about assembly and cabling $\$ Chapter 2 'Basics and mounting' on page 10.
L	

4.2 Start-up behavior

Turn on power supply

- The CPU checks whether a project AUTOLOAD.WLD exists on the memory card. If so, an overall reset is executed and the project is automatically loaded from the memory card.
- The CPU checks whether a command file with the name VIPA_CMD.MMC exists on the memory card. If so the command file is loaded from the memory card and the commands are executed.
- After PowerON and CPU STOP the CPU checks if there is a *.pkg file (firmware file) on the memory card. If so, this is shown by the CPU by blinking LEDs and the firmware may be installed by an update request. *\$ further information on page 87*
- The CPU checks if a previously activated VSC is inserted. If not, the SD LED gets on and a diagnostics entry is released. The CPU switches to STOP after 72 hours. With a just installed VSC activated functions remain activated. *Chapter 4.19 Diagnostic entries' on page 94*

After this the CPU switches to the operating mode, which is set on the operating mode switch.

Delivery state In the delivery state the CPU is overall reset. After a STOP→RUN transition the CPU switches to RUN without program.

Addressing > Default address assignment of the I/O part

4.3 Addressing

4.3.1 Overview

To provide specific addressing of the installed peripheral modules, certain addresses must be allocated in the CPU. This address mapping is in the CPU as hardware configuration. If there is no hardware configuration, depending on the slot, the CPU assigns automatically peripheral addresses for digital in-/output modules starting with 0 and analog modules are assigned to even addresses starting with 256.

4.3.2 Default address assignment of the I/O part

Sub module	Input address	Access	Description
AI5/AO2	800	WORD	Analog input channel 0 (X4)
	802	WORD	Analog input channel 1 (X4)

Sub module	Input address	Access	Description
DI24/DO16	136	BYTE	Digital input I+0.0 I+0.7 (X4)
	137	BYTE	Digital input I+1.0 I+1.7 (X4)

Sub module	Input address	Access	Description
Counter	816	DINT	Channel 0: Counter value / Frequency value
	820	DINT	Channel 1: Counter value / Frequency value
	824	DINT	Channel 2: Counter value / Frequency value
	828	DINT	Channel 3: Counter value / Frequency value

Sub module	Output address	Access	Description
DI24/DO16	136	BYTE	Digital output Q+0.0 Q+0.7 (X5)
	137	BYTE	Digital output Q+1.0 Q+1.3 (X5)

Sub module	Output address	Access	Description
Counter	816	DWORD	reserved
	820	DWORD	reserved
	824	DWORD	reserved
	828	DWORD	reserved

Addressing > Addressing periphery modules

4.3.3 Addressing periphery modules

The CPU 013-CCF0R00 provides an periphery area (address 0 ... 2047) and a process image of the in- and outputs (each address default 0 ... 127). The size of the process image can be adjusted via the parametrization. *Chapter 4.7 'Setting standard CPU parameters' on page 70*

The process image is updated automatically when a cycle has been completed. The process image is divided into two parts:

- Process image of the inputs (PII)
- Process image of the outputs (PIQ)

		1		3		5	
				· · ·		· · ·	
		2		4		6	
	2 Pe 3 Pr 4 Pr 5 Pr	eriphery area: 0 eriphery area : 0 ocess image of the ocess image of the ocess image of the ocess image of the	2047 e inputs (PII): 0 e inputs (PII): m e outputs (PIQ):	ax. 2047 0 127			
Max. number of modules	Up to 64 SLIO modules can be connected to a SLIO CPU. This sum includes power and clamp modules.						
Define addresses by hard- ware configuration	You may access the modules with read respectively write accesses to the peripheral bytes or the process image. To define addresses a hardware configuration may be used. For this, click on the properties of the according module and set the wanted address.						
Automatic addressing	If you do not like to use a hardware configuration, an automatic addressing is established. Here the address assignment follows the following specifications:						
		arting with slot 1, tl dresses.	he central plugg	ged modules are a	assigne	d with ascending I	logical
	ac	e length of the me cording module. In e according manua	formation abou	t the sizes of the			
		e memory areas o tput area.	f the modules a	are assigned with	out gaps	s separately for in	put and
		gital modules are r arting from address					
		s soon as the mapp e order, these are r				ess 256, by regard	ding

4.4 Hardware configuration - CPU Precondition The configuration of the CPU takes place at the Siemens 'hardware configurator'. The hardware configurator is part of the Siemens SIMATIC Manager. It serves for project engineering. Please use for configuration the Siemens SIMATIC Manager V 5.5 SP2 and up. The configuration of the System SLIO CPU happens in the Siemens SIMATIC Man-ager by means of a virtual PROFINET IO device 'VIPA SLIO CPU'. The 'VIPA SLIO System' is to be installed in the hardware catalog by means of the GSDML. For project engineering a thorough knowledge of the Siemens SIMATIC Manager and the Siemens hardware configurator is required! Installing the IO device The installation of the PROFINET IO devices 'VIPA SLIO CPU' happens in the hardware 'VIPA SLIO Svstem' catalog with the following approach: 1. Go to the service area of www.vipa.com. 2. ▶ Load from the download area at 'Config files → PROFINET' the according file for your System SLIO. 3. Extract the file into your working directory. 4. Start the Siemens hardware configurator. 5. Close all the projects. 6. ▶ Select 'Options → Install new GSD file' 7. Navigate to your working directory and install the according GSDML file. ⇒ After the installation according PROFINET IO device can be found at 'PROFINET IO → Additional field devices → I/O → VIPA SLIO System' Proceeding In the Siemens SIMATIC Manager the following steps should be executed: 1. Start the Siemens hardware configurator with a new project. **2.** Insert a profile rail from the hardware catalog. 3. Place at 'Slot'-Number 2 the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).

Slot	Module
1	
2	CPU 314C-2PN/DP
X1	MPI/DP
X2	PN-IO
X2	Port 1
Х2	Port 2
3	

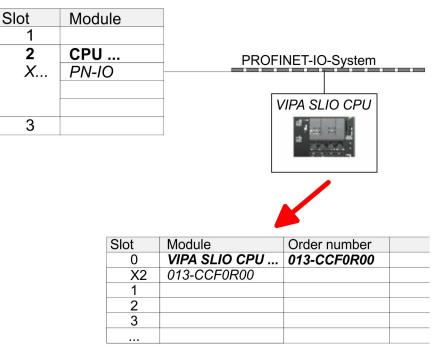

4. Click at the sub module '*PN-IO*' of the CPU.

5. ▶ Select 'Context menu → Insert PROFINET IO System'.

Hardware configuration - CPU

- 6. Create with [New] a new sub net and assign valid address data
- **7.** Click at the sub module *'PN-IO'* of the CPU and open with *'Context menu* \rightarrow *Properties'* the properties dialog.
- **8.** Enter at *'General'* a device name. The device name must be unique at the Ethernet subnet.

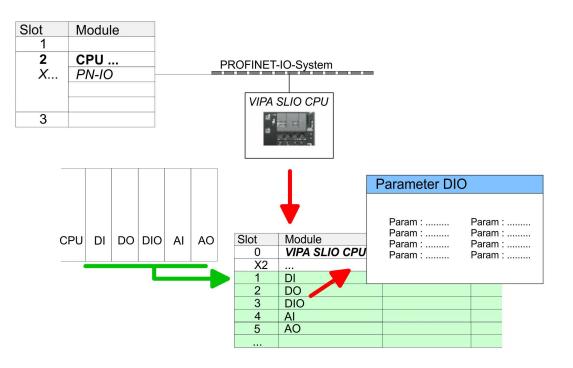

- Navigate in the hardware catalog to the directory 'PROFINET IO
 → Additional field devices → I/O → VIPA SLIO System' and connect the IO device '013-CCF0R00 CPU' to your PROFINET system.
 - ⇒ In the slot overview of the PROFINET IO device 'VIPA SLIO CPU' the CPU is already placed at slot 0. From slot 1 you can place your System SLIO modules.

4.5 Hardware configuration - System SLIO modules

System SLIO backplane bus To connect System SLIO modules, the CPU has a backplane bus, which must additionally to be supplied. Here up to 64 System SLIO modules can be connected.

Proceeding

- **1.** Perform, if not already done, a hardware configuration for the CPU. *Hardware configuration - CPU' on page 65*
- 2. Starting with slot 1 place in the slot overview of the PROFINET IO device "VIPA SLIO CPU" your System SLIO modules in the plugged sequence.
- **3.** Parametrize if necessary the modules and assign valid addresses, so that they can directly be addressed.

Hardware configuration - Ethernet PG/OP channel

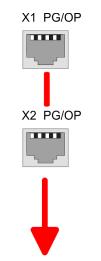

4.6 Hardware configuration - Ethernet PG/OP channel

Overview The CPU 013-CCF0R00 has an integrated Ethernet PG/OP channel. This channel allows you to program and remote control your CPU. The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2. The PG/OP channel also gives you access to the internal web page that contains information about firmware version, connected I/O devices, current cycle times etc. With the first start-up respectively after an overall reset the Ethernet PG/OP channel does not have any IP address. For online access to the CPU via Ethernet PG/OP channel valid IP address parame-ters have to be assigned to this. This is called "initialization". This can be done with the Siemens SIMATIC Manager. Assembly and commis-1. Install your System SLIO with your CPU. sioning 2. Wire the system by connecting cables for voltage supply and signals. 3. Connect the one of the Ethernet jacks (X1, X2) of the Ethernet PG/OP channel to Ethernet. **4.** Switch on the power supply. After a short boot time the CP is ready for communication. He possibly has no ⇒ IP address data and requires an initialization. "Initialization" via PLC

functions

The initialization via PLC functions takes place with the following proceeding:

Determine the current Ethernet (MAC) address of your Ethernet PG/OP channel. This can be found at the front of your CPU with the name "MAC PG/OP: ...".

MAC PG/OP: 00-20-D5-77-05-10

You get valid IP address parameters from your system administrator. The assignment of Assign IP address paramthe IP address data happens online in the Siemens SIMATIC Manager starting with version V 5.3 & SP3 with the following proceeding:

> 1. Start the Siemens SIMATIC Manager and set via 'Options' → Set PG/PC interface the access path to 'TCP/IP -> Network card'.

2. \triangleright Open with '*PLC* \rightarrow *Edit Ethernet Node n*' the dialog window with the same name.

eters

ters in project

Hardware configuration - Ethernet PG/OP channel > Time-of-day synchronization

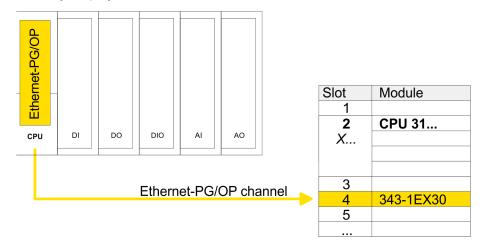

- 3. To get the stations and their MAC address, use the [Browse] button or type in the MAC Address. The Mac address may be found at the 1. label beneath the front flap of the CPU.
- **4.** Choose if necessary the known MAC address of the list of found stations.
- 5. Either type in the IP configuration like IP address, subnet mask and gateway.
- 6. Confirm with [Assign IP configuration].
 - ⇒ Direct after the assignment the Ethernet PG/OP channel may be reached online by these address data. The value remains as long as it is reassigned, it is overwritten by a hardware configuration or an factory reset is executed.
- Take IP address parame-1. Solution Open the Siemens hardware configurator and configure the Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
 - 2. For the Ethernet PG/OP channel you have to configure at slot 4 a Siemens CP 343-1 (SIMATIC 300 \ CP 300 \ Industrial Ethernet \CP 343-1 \ 6GK7 343-1EX30 0XE0 V3.0).

CAUTION!

Please configure the diagnostic addresses of the CP343-1EX30 for 'PN-IO', 'Port1' and 'Port2' so that there is no overlap in the peripheral input area. Otherwise, your CPU will not start and you will get the diagnostic entry 0xE904. These address overlaps can not be recognized by the Siemens SIMATIC Manager.

- 3. Solution Open the property window via double-click on the CP 343-1EX30 and enter for the CP at 'Properties' the IP address data, which you have assigned before.
- 4. Assign the CP to a 'Subnet'. Without assignment the IP address data are not used!
- 5. Transfer your project.

4.6.1 Time-of-day synchronization

NTP method

In the NTP mode (Network Time Protocol) the module sends as client time-of-day queries at regular intervals to all configured NTP servers within the sub net. You can define up to 4 NTP server. Based on the response from the servers, the most reliable and most exact time-of-day is determined. Here the time with the lowest stratum is used. Stratum 0 is the time standard (atomic clock). Stratum 1 are directly linked to this NTP server. Using the NTP method, clocks can be synchronized over subnet boundaries. The configuration of the NTP servers is carried out in the Siemens SIMATIC Manager via the CP, which is already configured.

Setting standard CPU parameters > Parameter CPU

Slot	Module	
1		
2 X	CPU 31	
Х		
3		
4	343-1EX30	
5		

- **1.** Open the properties dialog via double-click on the CP 343-1EX30.
- 2. Select the register 'Time-of-day synchronization'.
- **3.** Activate the NTP method by enabling 'Activate NTP time-of-day synchronization'.
- **4.** Click at [Add] and add the corresponding NTP server.
- 5. Select your 'time zone'. In the NTP method, UTC (Universal Time Coordinated) is generally transmitted; this corresponds to GMT (Greenwich Mean Time). By configuring the local time zone, you can set a time offset to UTC.
- 6. Close the dialog with [OK].
- 7. Save and transfer your project to the CPU.
 - After transmission, the NTP time is requested by each configured time server and the best response for the time synchronization is used.

Please note that although the time zone is evaluated, an automatic changeover from winter to summer time is not supported. Industrial systems with time-of-day synchronization should always be set in accordance to the winter time.

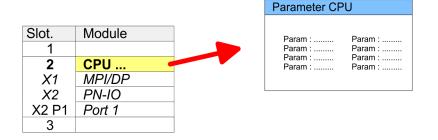

The FC 61 can be used to determine the local time in the CPU. More information about the usage of this block may be found in the manual "SPEED7 Operation List" from VIPA.

4.7 Setting standard CPU parameters

4.7.1 Parametrization via Siemens CPU

Parametrization via Siemens CPU 314-6EH04

Since the CPU from VIPA is to be configured as Siemens CPU 314C-2 PN/DP (6ES7 314-6EH04-0AB0 V3.3) in the Siemens hardware configurator, the standard parameters of the VIPA CPU may be set with "Object properties" of the CPU 314C-2 PN/DP during hardware configuration. Via a double-click on the CPU 314C-2 PN/DP the parameter window of the CPU may be accessed. Using the registers you get access to every standard parameter of the CPU.

4.7.2 Parameter CPU

Supported parameters

The CPU does not evaluate each parameter, which may be set at the hardware configuration. The parameters of the following registers are not supported: Synchronous cycle interrupts, communication and web. The following parameters are currently supported:

Conorol		Chart description
General		 Short description The short description of the Siemens CPU is CPU 314C-2 PN/DP
		(314-6EH04-0AB0 V3.3).
		Order No. / Firmware
		- Order number and firmware are identical to the details in the "hardware catalog"
	_	window.
		Name The Name field provides the short description of the CPU
		 The Name field provides the short description of the CPU. If you change the name the new name appears in the Siemens SIMATIC Man-
		ager.
		Plant designation
		 Here is the possibility to specify a plant designation for the CPU.
		 This plant designation identifies parts of the plant according to their function.
	_	 Its structure is hierarchic according to IEC 81346-1.
		 Location designation The location designation is part of the resource designation.
		 Here the exact location of your module within a plant may be specified.
		Comment
		 In this field information about the module may be entered.
Startup		Startup when expected/actual configuration differs
otaitap	_	 If the checkbox for 'Startup when expected/actual configuration differ' is dese-
		lected and at least one module is not located at its configured slot or if another
		type of module is inserted there instead, then the CPU does not switch to RUN mode and remains in STOP mode.
		 If the checkbox for 'Startup when expected/actual configuration differ' is selected,
		then the CPU starts even if there are modules not located in their configured slots
		of if another type of module is inserted there instead, such as during an initial
		system start-up. Monitoring time for ready message by modules [100ms]
	_	 This operation specifies the maximum time for the ready message of every con-
		figured module after PowerON.
		 Here connected PROFIBUS DP slaves are also considered until they are parame- tarized
		 terized. If the modules do not send a ready message to the CPU by the time the moni-
		toring time has expired, the actual configuration becomes unequal to the preset
		configuration.
		Monitoring time for transfer of parameters to modules [100ms]
		- The maximum time for the transfer of parameters to parameterizable modules.
		 Here connected PROFINET IO devices also considered until they are parameter- ized.
		- If not every module has been assigned parameters by the time this monitoring
		time has expired; the actual configuration becomes unequal to the preset configu-
		ration.
Cycle/Clock memory		Update OB1 process image cyclically
		 This parameter is not relevant. Scan cycle monitoring time
		 Here the scan cycle monitoring time in milliseconds may be set.
		 If the scan cycle time exceeds the scan cycle monitoring time, the CPU enters the
		STOP mode.
		 Possible reasons for exceeding the time are:
		- Communication processes
		- a series of interrupt events - an error in the CPU program

Setting standard CPU parameters > Parameter CPU

- Minimum scan cycle time
 - This parameter is not relevant.
- Scan cycle load from Communication
 - Using this parameter you can control the duration of communication processes, which always extend the scan cycle time so it does not exceed a specified length.
 - If the cycle load from communication is set to 50%, the scan cycle time of OB 1 can be doubled. At the same time, the scan cycle time of OB 1 is still being influenced by asynchronous events (e.g. hardware interrupts) as well.
- Size of the process image input/output area
 - Here the size of the process image max. 2048 for the input/output periphery may be fixed (default: 256).
- OB85 call up at I/O access error
 - The preset reaction of the CPU may be changed to an I/O access error that occurs during the update of the process image by the system.
 - The VIPA CPU is preset such that OB 85 is not called if an I/O access error occurs and no entry is made in the diagnostic buffer either.
- Clock memory
 - Activate the check box if you want to use clock memory and enter the number of the memory byte.

The selected memory byte cannot be used for temporary data storage.

Retentive Memory	 Number of Memory bytes from MB0 Enter the number of retentive memory bytes from memory byte 0 onwards. Number of S7 Timers from T0 Enter the number of retentive S7 timers from T0 onwards. Each S7 timer occupies 2bytes. Number of S7 Counters from C0 Enter the number of retentive S7 counter from C0 onwards. Areas This parameter is not supported.
Interrupts	 Priority Here the priorities are displayed, according to which the hardware interrupt OBs are processed (hardware interrupt, time-delay interrupt, async. error interrupts).
Time-of-day interrupts	 Priority This value is fixed to 2. Active By enabling 'Active' the time-of-day interrupt function is enabled. Execution Select how often the interrupts are to be triggered. Intervals ranging from every minute to yearly are available. The intervals apply to the settings made for <i>start date</i> and <i>time</i>. Start date/time Enter date and time of the first execution of the time-of-day interrupt. Process image partition This parameter is not supported.

Cyclic interrupts		Priority
		 Here the priorities may be specified according to which the corresponding cyclic interrupt is processed.
		Execution
		 Enter the time intervals in ms, in which the watchdog interrupt OBs should be processed.
		 The start time for the clock is when the operating mode switch is moved from STOP to RUN.
		 Phase offset Enter the delay time in ms for current execution for the watch dog interrupt. This
		should be performed if several watchdog interrupts are enabled.
		 Phase offset allows to distribute processing time for watchdog interrupts across the cycle.
		Process image partition
		 This parameter is not supported.
Diagnostics/Clock		Report cause of STOP
		 Activate this parameter, if the CPU should report the cause of STOP to PG respectively OP on transition to STOP.
		Number of messages in the diagnostics buffer
		 This parameter is ignored. The CPU always has a diagnostics buffer (circular buffer) for 100 diagnostics messages.
		Synchronization type
		 Here you specify whether clock should synchronize other clocks or not.
		 as slave: The clock is synchronized by another clock.
		 as master: The clock synchronizes other clocks as master.
	÷.	 none: There is no synchronization Time interval
	_	 Time intervals within which the synchronization is to be carried out.
		Correction factor
		 Lose or gain in the clock time may be compensated within a 24 hour period by means of the correction factor in ms.
		 If the clock is 1s slow after 24 hours, you have to specify a correction factor of "+1000" ms.
Protection		Level of protection
		 Here 1 of 3 protection levels may be set to protect the CPU from unauthorized
		access.
		 Protection level 1 (default setting): No password adjustable, no restrictions
		 Protection level 2 with password:
		Authorized users: read and write access
		Unauthorized user: read access only
		 Protection level 3: Authorized users: read and write cases
		Authorized users: read and write access Unauthorized user: no read and write access

4.7.3 Parameter for MPI/DP

The properties dialog of the MPI(PtP) interface X3 is opened via a double click to the sub module MPI/DP

Setting VIPA specific CPU parameters

To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a VSC storage media from VIPA. By plugging the VSC storage card and then an overall reset the according functionality is activated. & Chapter 4.15 'Deployment storage media - VSD, VSC' on page 88 General Short description Here the short description "MPI/DP" for the interface is specified. Name At Name "MPI/DP" is shown. If you change the name, the new name appears in the Siemens SIMATIC Manager. Type Here you can choose between the functionalities MPI and PROFIBUS. _ Interface Here the MPI respectively PROFIBUS address is shown. Properties With this button the properties of the interface may be pre-set. Comment You can enter the purpose of the interface.

Address

- Diagnostics
 - A diagnostics address for the interface is to be pre-set here. In the case of an error the CPU is informed via this address.
- Operating mode
 - With the interface type 'PROFIBUS' here you can pre-set the 'Operating mode' DP Slave.
- Configuration, Clock
 - These parameters are not supported.

4.8 Setting VIPA specific CPU parameters

Overview

Except of the VIPA specific CPU parameters the CPU parametrization takes place in the parameter dialog of the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) from Siemens. After the hardware configuration of the CPU you can set the parameters of the CPU in the virtual IO device *'VIPA SLIO CPU'*. Via double-click at the VIPA SLIO CPU the properties dialog is opened

Here the following parameters may be accessed:

- Function X3
- Additional retentive memory
- Additional retentive timer
- Additional retentive counter
- Diagnostics interrupt 5L+ (DC 24V DI power section supply)
- Diagnostics interrupt 2L+ (DC 24V DO power section supply)
- Diagnostics interrupt DO short circuit / overload
- Diagnostics interrupt sensor short circuit / overload
- Diagnostics interrupt 3L+ (DC 24V SLIO bus power section supply)

VIPA specific parameters

The following parameters may be accessed by means of the properties dialog of the VIPA CPU.

- Function X3
 - MPI/DP (default): In this operating mode parameters are active, which you set on sub module 'MPI/DP' of the Siemens CPU 314C-2 PN/DP. Schapter 8 'Option: Deployment PROFIBUS communication' on page 175
 - PTP: With this operating mode the RS485 interface acts as an interface for serial point-to-point communication. Here data may be exchanged between two stations by means of protocols.
 Chapter 6 'Deployment PtP communication' on page 147
- Additional retentive memory
 - Here enter the number of retentive memory bytes. With 0 the value *Retentive memory* → Number of memory bytes starting with MB0' is set, which is pre-set at the parameters of the Siemens CPU.
 - Range of values: 0 (default) ... 8192
- Additional retentive timer
 - Enter the number of S7 timers. With 0 the value 'Retentive memory
 → Number S7 timers starting with T0' is set, which is pre-set at the parameters of the Siemens CPU.
 - Range of values: 0 (default) ... 512
- Additional retentive counter
 - Enter the number of S7 counter. With 0 the value 'Retentive memory
 → Number S7 counters starting with C0' is set, which is pre-set at the parameters of the Siemens CPU.
 - Range of values: 0 (default) ... 512
- Diagnostics interrupt (default: deactivated)
 - Error: 5L+ (DC 24V DI power section supply)
 - Error: 2L+ (DC 24V DO power section supply)
 - Error: 3L+ (DC 24V SLIO bus power section supply)
 - Short circuit / overload: DO
 - Short circuit / overload: Sensor

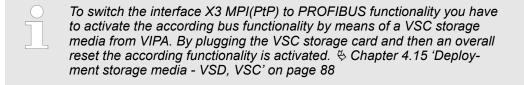

Project transfer > Transfer via MPI

4.9 Project transfer

Overview

There are the following possibilities for project transfer into the CPU:

- Transfer via MPI
- Transfer via Ethernet
- Transfer via memory card

4.9.1 Transfer via MPI	
General	For transfer via MPI the CPU has the following interface:
Net structure	The structure of a MPI net is electrically identical with the structure of a PROFIBUS net. This means the same rules are valid and you use the same components for the build-up. The single participants are connected with each other via bus interface plugs and PROFIBUS cables. Per default the MPI net runs with 187.5kbaud. VIPA CPUs are deliv- ered with MPI address 2.
MPI programming cable	The MPI programming cables are available at VIPA in different variants. The cables pro- vide a RS232 res. USB plug for the PC and a bus enabled RS485 plug for the CPU. Due to the RS485 connection you may plug the MPI programming cables directly to an already plugged plug on the RS485 jack. Every bus participant identifies itself at the bus with an unique address, in the course of the address 0 is reserved for programming devices.
Terminating resistor	A cable has to be terminated with its surge impedance. For this you switch on the termi- nating resistor at the first and the last participant of a network or a segment. Please make sure that the participants with the activated terminating resistors are always power sup- plied. Otherwise it may cause interferences on the bus.

- 1 MPI programming cable
- 2 Activate the terminating resistor via switch

1

3 MPI network

Approach transfer via MPI interface

- *ia MPI* **1.** Connect your PC to the MPI jack of your CPU via a MPI programming cable.
 - **2.** Load your project in the SIMATIC Manager from Siemens.
 - 3. ▶ Choose in the menu 'Options → Set PG/PC interface'.
 - **4.** Select in the according list the "PC Adapter (MPI)"; if appropriate you have to add it first, then click on [Properties].
 - **5.** Set in the register MPI the transfer parameters of your MPI net and type a valid *address*.
 - **6.** Switch to the register *Local connection*.
 - **7.** Set the COM port of the PCs and the transfer rate 38400baud for the MPI programming cable from VIPA.
 - **8.** Transfer your project via '*PLC* \rightarrow Load to module' via MPI to the CPU and save it with '*PLC* \rightarrow Copy RAM to ROM' on a memory card if one is plugged.

4.9.2 Transfer via Ethernet

Initialization	 So that you may access the according Ethernet interface you have to assign IP address parameters by means of the "initialization". X1/X2: Ethernet PG/OP channel
Transfer	 For the transfer, connect, if not already done, the appropriate Ethernet port to your Ethernet. Open your project with the Siemens SIMATIC Manager. Set via 'Options → Set PG/PC Interface' the access path to "TCP/IP → Network card ". Click to 'PLC → Download' Download → the dialog "Select target module" is opened. Select your target module and enter the IP address parameters of the Ethernet PG/OP channel for connection. Provided that no new hardware configuration is transferred to the CPU, the entered Ethernet connection is permanently stored in the project as transfer channel. With [OK] the transfer is started.
	 System dependent you get a message that the projected system differs from target system. This message may be accepted by [OK]. → Your project is transferred and may be executed in the CPU after

4.9.3 Transfer via memory card

Proceeding transfer via memory card	The memory card serves as external storage medium. There may be stored several proj- ects and sub-directories on a memory card. Please regard that your current project is stored in the root directory and has one of the following file names:

- S7PROG.WLD
- AUTOLOAD.WLD

transfer.

- 1. Start the Siemens SIMATIC Manager with your project
- 2. ▶ Create with 'File → Memory Card File → New' a new wld file.

Accessing the web server > Web page with selected CPU

- **3.** Copy the blocks from the project blocks folder and the *System data* into the wld file.
- **4.** Copy the wld file at a suited memory card. Plug this into your CPU and start it again.
 - ⇒ The transfer of the application program from the memory card into the CPU takes place depending on the file name after an overall reset or PowerON.

S7PROG.WLD is read from the memory card after overall reset.

AUTOLOAD.WLD is read from the memory card after PowerON.

The blinking of the SD LED of the CPU marks the active transfer. Please regard that your user memory serves for enough space for your user program, otherwise your user program is not completely loaded and the SF LED gets on.

4.10 Accessing the web server

4.10.1 Access via the Ethernet PG/OP channel

There is a web server, which can be accessed via the IP address of the Ethernet PG/OP channel with an Internet browser. At the web page information about the CPU and its connected modules can be found. \Leftrightarrow Chapter 4.6 'Hardware configuration - Ethernet PG/OP channel' on page 68

It is assumed that there is a connection between PC and CPU with Internet browser via the Ethernet PG/OP channel. This may be tested by Ping to the IP address of the Ethernet PG/OP channel.

4.10.2 Structure of the web page

The web page is built dynamically and depends on the number of modules, which are connected to the CPU. The web page only shows information. The shown values cannot be changed

Please consider the System SLIO power and clamp modules do not have any module ID. These may not be recognized by the CPU and so are not listed and considered during slot allocation.

Parameter	With parameterizable modules e.g. analog modules the parameter setting is shown here. These come from the hardware configuration.

Operating modes > Overview

4.11 Operating modes

4.11.1 Overview

The CPU can be in one of 4 operating modes:

- Operating mode STOP
- Operating mode START-UP
 - (OB 100 restart / OB 102 cold start *)
- Operating mode RUN
- Operating mode HOLD

Certain conditions in the operating modes START-UP and RUN require a specific reaction from the system program. In this case the application interface is often provided by a call to an organization block that was included specifically for this event.

Operating mode STOP The application program is not processed.

- If there has been a processing before, the values of counters, timers, flags and the process image are retained during the transition to the STOP mode.
- Command output disable (BASP) is activated this means the all digital outputs are disabled.
- RUN-LED off
- STOP-LED on

Operating mode START- During the transition from STOP to RUN a call is issued to the start-up organization block OB 100.

- The processing time for this OB is not monitored.
- The START-UP OB may issue calls to other blocks.
- All digital outputs are disabled during the START-UP, this means BASP is activated.
- RUN LED
 - The RUN LED blinks as soon as the OB 100 is operated and for at least 3s, even if the start-up time is shorter or the CPU gets to STOP due to an error.
 - This indicates the start-up.
- STOP LED
- During the processing of the OB 100 the STOP LED is on and then turns off.
- When the CPU has completed the START-UP OB, it assumes the operating mode RUN.

* OB 102 (Cold start)

If there is a "Watchdog" error the CPU still remains in STOP state. With such an error the CPU must be manually started again. For this the OB 102 (cold start) must exist. The CPU will not go to RUN without the OB 102. Alternatively you can bring your CPU in RUN state again by an overall reset respectively by reloading your project.

Please consider that the OB 102 (cold start) may exclusively be used for treatment of a watchdog error.

Operating mode RUN

- The application program in OB 1 is processed in a cycle. Under the control of alarms other program sections can be included in the cycle.
- All timers and counters being started by the program are active and the process image is updated with every cycle.
- BASP is deactivated, i.e. all outputs are enabled.
- RUN-LED on
- STOP-LED off

VIPA System SLIO	Deployment CPU 013-CCF0R00
	Operating modes > Function security
Operating mode HOLD	The CPU offers up to 3 breakpoints to be defined for program diagnosis. Setting and deletion of breakpoints happens in your programming environment. As soon as a breakpoint is reached, you may process your program step by step.
Precondition	For the usage of breakpoints, the following preconditions have to be fulfilled:
	■ Testing in single step mode is possible with STL. If necessary switch the view via View → STL' to STL.
	 The block must be opened online and must not be protected.
Approach for working with	1. ▶ Activate 'View → Breakpoint Bar'.
breakpoints	2. Set the cursor to the command line where you want to insert a breakpoint.
	3. ▶ Set the breakpoint with 'Debug → Set Breakpoint'.
	⇒ The according command line is marked with a circle.
	4. ▶ To activate the breakpoint click on <i>'Debug → Breakpoints Active'</i> .
	\Rightarrow The circle is changed to a filled circle.
	5. Bring your CPU into RUN.
	When the program reaches the breakpoint, your CPU switches to the state HOLD, the breakpoint is marked with an arrow and the register contents are monitored.
	 6. Now you may execute the program code step by step via 'Debug → Execute Next Statement' or run the program until the next breakpoint via 'Debug → Resume'.
	7. Delete (all) breakpoints with the option 'Debug → Delete All Breakpoints'.
Behavior in operating state HOLD	 The RUN-LED blinks and the STOP-LED is on. The execution of the code is stopped. No level is further executed. All times are frozen. The real-time clock runs is just running. The outputs were disabled (BASP is activated). Configured CP connections remain exist.
	The usage of breakpoints is always possible. Switching to the operating mode test operation is not necessary.

With more than 2 breakpoints, a single step execution is not possible.

4.11.2 Function security

The CPUs include security mechanisms like a Watchdog (100ms) and a parameterizable cycle time surveillance (parameterizable min. 1ms) that stop res. execute a RESET at the CPU in case of an error and set it into a defined STOP state. The VIPA CPUs are developed function secure and have the following system properties:

Deployment CPU 013-CCF0R00

Operating modes > Function security

Event	concerns	Effect
$RUN\toSTOP$	general	BASP (B efehls- A usgabe- Sp erre, i.e. command output lock) is set.
	central digital outputs	The outputs are disabled.
	central analog outputs	The outputs are disabled.
		 Voltage outputs issue 0V Current outputs 020mA issue 0mA Current outputs 420mA issue 4mA If configured also substitute values may be issued.
	decentral outputs	Same behaviour as the central digital/analog outputs.
	decentral inputs	The inputs are cyclically be read by the decentralized station and the recent values are put at disposal.
STOP \rightarrow RUN res. PowerON	general	First the PII is deleted, then OB 100 is called. After the execution of the OB, the BASP is reset and the cycle starts with:
		Delete PIO \rightarrow Read PII \rightarrow OB 1.
	decentral inputs	The inputs are be read by the decentralized station and the recent values are put at disposal.
RUN	general	The program is cyclically executed:
		Read PII \rightarrow OB 1 \rightarrow Write PIO.

PII = Process image inputs

PIO = Process image outputs

4.12 **Overall reset** Overview During the overall reset the entire user memory is erased. Data located in the memory card is not affected. You have 2 options to initiate an overall reset: Overall reset by means of the operating mode switch Overall reset by means of a configuration tool like e.g. the Siemens SIMATIC Manager You should always establish an overall reset to your CPU before loading an application program into your CPU to ensure that all blocks have been cleared from the CPU. Overall reset by means of the operating mode switch 4.12.1 Proceeding RN 1. Your CPU must be in STOP mode. For this switch the operating mode switch of the CPU to STOP. ST ⇒ The ST LED is on. MR RUN **2.** Switch the operating mode switch to MR position for about 3 seconds. STOP ⇒ The ST LED changes from blinking to permanently on. MR RN 3. Place the operating mode switch in the position STOP and switch it to MR and quickly back to STOP within a period of less than 3 seconds.

The overall reset is carried out. Here the ST LED flashes.

4. The overall reset has been completed when the ST LED is permanently on.

4.12.2 Overall reset by means of the Siemens SIMATIC Manager

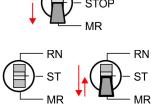

Proceeding

For the following proceeding you must be online connected to your CPU.

- 1. For an overall reset the CPU must be switched to STOP state. You may place the CPU in STOP by the menu command 'PLC → Operating mode'.
- 2. You may request the overall reset by means of the menu command 'PLC → Clean/Reset'.
 - A dialog window opens. Here you can bring your CPU in STOP state, if not ⇒ already done, and start the overall reset. During the overall reset procedure the ST LED flashes. When the ST LED is on permanently the overall reset procedure has been completed.

4.12.3 Actions after a memory reset

Activating functionality by If there is a VSC from VIPA plugged, after an overall reset the according functionality is means of a VSC automatically activated. & 'VSD' on page 89

Firmware update	
-----------------	--

Automatic reload	If there is a project S7PROG.WLD on the memory card, after an overall reset the CPU attempts to reload this project from the memory card. \rightarrow The SD LED is on. When the reload has been completed the LED expires. The operating mode of the CPU will be STOP respectively RUN, depending on the position of the operating mode switch.
Reset to factory setting	The <i>Reset to factory setting</i> deletes completely the internal RAM of the CPU and resets this to delivery state. Please regard that the MPI address is also set back to default 2! <i>Chapter 4.14 'Reset to factory settings' on page 88</i>

4.13 Firmware update

Current firmware at www.vipa.com The latest firmware versions can be found in the service area at www.vipa.com. For example the following files are necessary for the firmware update of the CPU 013- CCF0R00 and its components with hardware release 01:	There is the opportunity to execute a firmware update for the CPU and its components via memory card. For this an accordingly prepared memory card must be in the CPU during the start-up. So a firmware files can be recognized and assigned with start-up, a pkg file name is reserved for each update-able component and hardware release, which begins with "px" and differs in a number with 6 digits. The pkg file name of every update-able component can be found at a label on the module. The SLIO CPU has no label. Here the pkg file name can be shown via the web page. After PowerON and operating mode switch in STOP position, the CPU checks if there is a *.pkg file at the memory card. If this firmware version is different to the existing firmware version, this is indicated by blinking of the LEDs and the firmware may be installed by an update request.		
CPU 013C, Hardware release 01: Px000265.pkg			
CAUTION!When installing a new firmware you have to be extremely careful. Under certain circumstances you may destroy the CPU, for example if the voltage supply is interrupted during transfer or if the firmware file is defec- tive. In this case, please call our hotline!Please regard that the version of the update firmware has to be different from the existing firmware otherwise no update is executed.			
Display the firmware ver- sion via web page The CPU has an integrated web page that monitors information about the firmware ver- sion of the SPEED7 components. The Ethernet PG/OP channel provides the access this web page. To activate the PG/OP channel you have to enter according IP parameters. This happens in the Siemens SIMATIC Manager either by a hardware configuration loaded by memory card respectively MPI or via Ethernet by means of the MAC addres with ' <i>PLC</i> \rightarrow <i>Assign Ethernet Address</i> '. After that you may access the PG/OP channel with a web browser via the set IP address. \Leftrightarrow <i>Chapter 4.6 'Hardware configuration -</i> <i>Ethernet PG/OP channel' on page 68</i>	io 9- ion, ss		
 Load firmware and transfer it to memory card 1. Go to www.vipa.com 2. Click 'Service Support → Downloads → Firmware'. 3. Via 'System SLIO → CPU' navigate to your CPU and download the zip file to your CPU. 4. Unzip the zip file and copy the pgk file to the root directory of your memory card 			

Firmware update

CAUTION!

With a firmware update an overall reset is automatically executed. If your program is only available in the load memory of the CPU it is deleted! Save your program before executing a firmware update! After a firmware update you should execute a "Reset to factory setting". \Leftrightarrow Chapter 4.14 'Reset to factory settings' on page 88

Please note that with some firmware versions an additional firmware update via alternate blinking of the LEDs SF and FC can be indicated even when the operating mode switch is in RUN position. In this state the CPU can only restart, if you establish a further firmware update process. For this tap the operating mode switch shortly downwards to MR and

Transfer firmware from memory card into CPU

RN ST MR

1. Switch the operating mode switch of your CPU in position STOP.

follow the procedures described below.

- **2.** Turn off the power supply.
- **3.** Plug the memory card with the firmware files into the CPU. Please take care of the correct plug-in direction of the memory card.
- **4.** Turn on the power supply.
 - After a short boot-up time, the alternate blinking of the LEDs SF and FC shows that at least a more current firmware file was found at the memory card.
- **5.** You start the transfer of the firmware as soon as you tip the operating mode switch downwards to MR within 10s and then leave the switch in STOP position.
 - ⇒ During the update process, the LEDs SF and FC are alternately blinking and SD LED is on. This may last several minutes.
- **6.** The update is successful finished when the LEDs PW, ST, SF, FC and SD are on. If they are blinking fast, an error occurred.
- 7. Turn power OFF and ON.
 - ⇒ Now it is checked by the CPU, whether further firmware updates are to be executed. If so, again the LEDs SF and FC flash after a short start-up period. Continue with step 5. If the LEDs do not flash, the firmware update is finished.

Deployment storage media - VSD, VSC

4.14 Reset to factory settings

Proceeding

- With the following proceeding the internal RAM of the CPU is completely deleted and the CPU is reset to delivery state.
- Please regard that the MPI address is also reset to default 2 and the IP address of the Ethernet PG/OP channel is reset to 0.0.0.0!
- A factory reset may also be executed by the command FACTORY_RESET.
 & Chapter 4.17 'CMD auto commands' on page 91
- 1. Switch the CPU to STOP.
- 2. Push the operating mode switch down to position MR for 30 seconds. Here the ST LED blinks. After a few seconds the ST LED changes to static light. Now the ST LED changes between static light and blinking. Start here to count the static light of the ST LED.
- **3.** After the 6. Static light release the operating mode switch and tip it downwards to MR.
 - ⇒ For the confirmation of the resetting procedure the green RN LED lights up once. This means that the RAM was deleted completely.

If the ST LED is on, only an overall reset has been performed and the reset to factory setting has been failed. In this case you can repeat the procedure. A factory reset can only be executed if the ST LED has static light for exact 6 times.

4. The update is successful finished when the LEDs PW, ST, SF, FC and MC are on.

5. Turn power OFF and ON.

After a firmware update of the CPU you always should execute a factory reset.

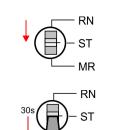

4.15 Deployment storage media - VSD, VSC

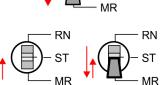

Overview

At the front of the CPU there is a slot for storage media. Here the following storage media can be plugged:

- VSD VIPA SD-Card
 - External memory card for programs and firmware.
- VSC VIPASetCard
 - External memory card (VSD) for programs and firmware with the possibility to unlock optional functions like work memory and field bus interfaces.
 - These functions can be purchased separately.
 - To activate the corresponding card is to be installed and a Overall reset is to be established. Schapter 4.12 'Overall reset' on page 85

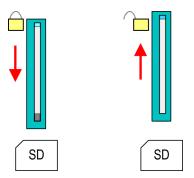

You can cause the CPU to load a project automatically respectively to execute a command file by means of pre-defined file names.

VSD

VSDs are external storage media based on SD memory cards. VSDs are pre-formatted with the PC format FAT 16 (max. 2GB) and can be accessed via a card reader. After PowerON respectively an overall reset the CPU checks, if there is a VSD with data valid for the CPU.

Push the VSD into the slot until it snaps in leaded by a spring mechanism. This ensures contacting. By sliding down the sliding mechanism, a just installed VSD card can be protected against drop out.

To remove, slide the sliding mechanism up again and push the storage media against the spring pressure until it is unlocked with a click.

CAUTION!

If the media was already unlocked by the spring mechanism, with shifting the sliding mechanism, a just installed memory card can jump out of the slot!

The VSC is a VSD with the possibility to enable optional functions. Here you have the opportunity to accordingly expand your work memory respectively enable field bus functions. Information about the enabled functions can be shown via the web page. *Schapter 4.10 'Accessing the web server' on page 78*

CAUTION!

Please regard that the VSC must remain plugged when you've enabled optional functions at your CPU. Otherwise the SF LED is on and the CPU switches to STOP after 72 hours. As soon as an activated VSC is not plugged, the SF LED is on and the "TrialTime" counts downwards from 72 hours to 0. After 72 hours the CPU switches to STOP state. By plugging the VSC, the SF LED expires and the CPU is running again without any restrictions.

The VSC cannot be replaced by a VSC of the same optional functions. The activation code is fixed to the VSD by means of an unique serial number. Here the function as an external memory card is not affected.

VSC

Extended know-how protection

Accessing the storage medium

To the following times an access takes place on a storage medium:

After overall reset

- The CPU checks if a VSC is inserted. If so, the corresponding optional functions are enabled.
- The CPU checks whether a project S7PROG.WLD exists. If so, it is automatically loaded.

After PowerON

- The CPU checks whether a project AUTOLOAD.WLD exists. If so, an overall reset is executed and the project is automatically loaded.
- The CPU checks whether a command file with the name VIPA_CMD.MMC exists. If so the command file is loaded and the commands are executed.
- After PowerON and CPU STOP the CPU checks if there is a *.pkg file (firmware file). If so, this is shown by the CPU by blinking LEDs and the firmware may be installed by an update request. Chapter 4.13 'Firmware update' on page 86

Once in STOP state

If a memory card is plugged, which contains a command file VIPA_CMD.MMC, the command file is loaded and the containing instructions are executed.

The FC/SFC 208 ... FC/SFC 215 and FC/SFC 195 allow you to include the memory card access into your user application. More can be found in the manual "Operation list".

4.16 Extended know-how protection

Overview

Besides the "standard" Know-how protection the CPUs from VIPA provide an "extended" know-how protection that serves a secure block protection for accesses of 3. persons.

- Standard protection
 - The standard protection from Siemens transfers also protected blocks to the PG but their content is not displayed.
 - But with according manipulation the know-how protection is not guaranteed.
- Extended protection
 - The "extended" know-how protection developed by VIPA offers the opportunity to store blocks permanently in the CPU.
 - With the "extended" protection you transfer the protected blocks to a memory card into a WLD-file named protect.wld.
 - By plugging the memory card and then an overall reset the blocks in the protect.wld are permanently stored in the CPU.
 - You may protect OBs, FBs and FCs.
 - When back-reading the protected blocks into the PG, exclusively the block header are loaded. The block code that is to be protected remains in the CPU and cannot be read.

Protect blocks with protect.wld

- 1. Create a new wld file in your project engineering tool with 'File → Memory Card file → New'.
- 2. Rename the wld file to "protect.wld".
- **3.** Transfer the according blocks into the file by dragging them with the mouse from the project to the file window of protect.wld.
- **<u>4.</u>** Transfer the file protect.wld to a memory card.

CMD - auto commands

	5. Plug the memory card into the CPU and execute an overall reset. <i>Overall reset' on page 85</i>
	⇒ The overall reset stores the blocks in protect.wld permanently in the CPU pro- tected from accesses of 3. persons.
Protection behaviour	Protected blocks are overwritten by a new protect.wld. Using a PG 3. persons may access protected blocks but only the block header is transferred to the PG. The block code that is to be protected remains in the CPU and cannot be read.
Change respectively delete protected blocks	Protected blocks in the RAM of the CPU may be substituted at any time by blocks with the same name. This change remains up to next overall reset. Protected blocks may per- manently be overwritten only if these are deleted at the protect.wld before. By transferring an empty protect.wld from the memory card with an overall reset, you may delete all pro- tected blocks in the CPU.
Usage of protected blocks	Due to the fact that reading of a "protected" block from the CPU monitors no symbol labels it is convenient to provide the "block covers" for the end user. For this, create a project of all protected blocks. Delete all networks in the blocks so that these only contain the variable definitions in the according symbolism.

4.17 CMD - auto commands

Overview	A <i>Command</i> file at a memory card is automatically executed under the following conditions:
	 CPU is in STOP and memory card is plugged After each PowerON
Command file	The <i>Command</i> file is a text file, which consists of a command sequence to be stored as vipa_cmd.mmc in the root directory of the memory card. The file has to be started by CMD_START as 1. command, followed by the desired commands (no other text) and must be finished by CMD_END as last command.
	Text after the last command <i>CMD_END</i> e.g. comments is permissible, because this is ignored. As soon as the command file is recognized and executed each action is stored at the memory card in the log file logfile.txt. In addition for each executed command a diagnostics entry may be found in the diagnostics buffer.
Commands	Please regard the command sequence is to be started with <i>CMD_START</i> and ended with <i>CMD_END</i> .

Command	Description	Diagnostics entry
CMD_START	In the first line CMD_START is to be located.	0xE801
	There is a diagnostics entry if CMD_START is missing.	0xE8FE
WAIT1SECOND	Waits about 1 second.	0xE803
LOAD_PROJECT	The function "Overall reset and reload from memory card" is executed. The wld file located after the command is loaded else "s7prog.wld" is loaded.	0xE805

CMD - auto commands

Command	Description	Diagnostics entry
SAVE_PROJECT	The recent project (blocks and hardware configuration) is stored as "s7prog.wld" at the memory card. If the file just exists it is renamed to "s7prog.old". If your CPU is password protected so you have to add this as parameter. Otherwise there is no project written.	0xE806
	Example: SAVE_PROJECT password	
FACTORY_RESET	Executes "factory reset".	0xE807
DIAGBUF	The current diagnostics buffer of the CPU is stored as "dia- gbuff.txt" at the memory card.	0xE80B
SET_NETWORK	IP parameters for Ethernet PG/OP channel may be set by means of this command. The IP parameters are to be given in the order IP address, subnet mask and gateway in the format x.x.x.x each separated by a comma. Enter the IP address if there is no gateway used.	0xE80E
CMD_END	In the last line CMD_END is to be located.	0xE802
CMD_END	In the last line CMD_END is to be located.	UXE802

Examples	The structure of a command file is shown in the following. The corresponding diagnostics
	entry is put in parenthesizes.

Example 1

CMD_START	Marks the start of the command sequence (0xE801)
LOAD_PROJECT proj.wld	Execute an overall reset and load "proj.wld" (0xE805)
WAIT1SECOND	Wait ca. 1s (0xE803)
DIAGBUF	Store diagnostics buffer of the CPU as "diagbuff.txt" (0xE80B)
CMD_END	Marks the end of the command sequence (0xE802)
arbitrary text	Text after the command CMD_END is not evaluated.

Example 2

CMD_START	Marks the start of the command sequence (0xE801)
LOAD_PROJECT proj2.wld	Execute an overall reset and load "proj2.wld" (0xE805)
WAIT1SECOND	Wait ca. 1s (0xE803)
WAIT1SECOND	Wait ca. 1s (0xE803)
	IP parameter (0xE80E)
SET_NETWORK 172.16.129.210,255.255.2	24.0,172.16.129.210
WAIT1SECOND	Wait ca. 1s (0xE803)
WAIT1SECOND	Wait ca. 1s (0xE803)
DIAGBUF	Store diagnostics buffer of the CPU as "diagbuff.txt" (0xE80B)
CMD_END	Marks the end of the command sequence (0xE802)
arbitrary text	Text after the command CMD_END is not evaluated.

Control and monitoring of variables with test functions

\bigcirc
1

The parameters IP address, subnet mask and gateway may be received from the system administrator. Enter the IP address if there is no gateway used.

4.18 Control and monitoring of variables with test functions

Overview

- For troubleshooting purposes and to display the status of certain variables you can access certain test functions via the menu item **Debug** of the Siemens SIMATIC Manager.
- The status of the operands and the RLO can be displayed by means of the test function 'Debug → Monitor'.
- The status of the operands and the RLO can be displayed by means of the test function '*PLC* → *Monitor/Modify Variables*'.

'Debug -> Monitor'

- This test function displays the current status and the RLO of the different operands while the program is being executed.
- It is also possible to enter corrections to the program.
- The processing of the states may be interrupted by means of jump commands or by timer and process-related interrupts.
- At the breakpoint the CPU stops collecting data for the status display and instead of the required data it only provides the PG with data containing the value 0.
- The interruption of the processing of statuses does not change the execution of the program. It only shows that the data displayed is no longer valid.

When using the test function "Monitor" the PLC must be in RUN mode!

For this reason, jumps or time and process alarms can result in the value displayed during program execution remaining at 0 for the items below:

- the result of the logical operation RLO
- Status / AKKU 1
- AKKU 2
- Condition byte
- absolute memory address SAZ. In this case SAZ is followed by a "?".

Diagnostic entries

'PLC → Monitor/Modify Variables'

This test function returns the condition of a selected operand (inputs, outputs, flags, data word, counters or timers) at the end of program execution. This information is obtained from the corresponding area of the selected operands. During the controlling of variables respectively in operating mode STOP the input area is directly read. Otherwise only the process image of the selected operands is displayed.

- Control of outputs
 - Serves to check the wiring and proper operation of output modules.
 - If the CPU is in RUN mode, so only outputs can be controlled, which are not controlled by the user program. Otherwise values would be instantly overwritten.
 - If the CPU is in STOP even without user program, so you need to disable the command output lock BASP (*'Enable PO'*). Then you can control the outputs arbitrarily
- Controlling variables
 - The following variables may be modified: I, Q, M, T, C and D.
 - The process image of binary and digital operands is modified independently of the operating mode of the CPU.
 - When the operating mode is RUN the program is executed with the modified process variable. When the program continues they may, however, be modified again without notification.
- Forcing variables
 - You can pre-set individual variables of a user program with fixed values so that they can not be changed or overwritten by the user program of the CPU.
 - By pre-setting of variables with fixed values, you can set certain situations for your user program and thus test the programmed functions.

CAUTION!

Please consider that controlling of output values represents a potentially dangerous condition.

Even after a power cycle forced variables remain forced with its value, until the force function is disabled.

These functions should only be used for test purposes respectively for troubleshooting. More information about the usage of these functions may be found in the manual of your configuration tool.

4.19 Diagnostic entries

Accessing diagnostic data

System specific event IDs' on page 222

- You may read the diagnostics buffer of the CPU via the Siemens SIMATIC Manager. Besides of the standard entries in the diagnostics buffer, the VIPA CPUs support some additional specific entries as Event-IDs.
- To monitor the diagnostics entries you choose in the Siemens SIMATIC manager 'PLC → Module information'. Via the register "Diagnostics Buffer" you reach the diagnostics window.
- The diagnostic is independent from the operating mode of the CPU. You may store a max. of 100 diagnostic entries in the CPU.

VIPA System SLIO

Overview

5 Deployment I/O periphery

5.1 Overview

Project engineering and parametrization	On this CPU the connectors for digital respectively analog signal and <i>Technological functions</i> are combined in a one casing.
	The project engineering happens in the Siemens SIMATIC Manager as Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3). Here the CPU 013-CCF0R00 is parameterized via the 'Properties' dialog of the Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
	For parametrization of the digital I/O periphery and the <i>technological functions</i> the corresponding sub modules of the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) is to be used.
	The controlling of the operating modes of the <i>technological functions</i> happens by means of handling blocks of the user program.
I/O periphery	The integrated I/Os of the CPU may be used for <i>technological functions</i> or as standard periphery.
	Technological functions and standard periphery may be used simultaneously with appropriate hardware.
	 Read access to inputs used by <i>technological functions</i> is possible. Write access to used outputs is not possible.
	 Chapter 5.3 'Analog input' on page 97 2xUx12Bit (0 10V) The analog channels of the module are not isolated to the electronic power supply.
	 The analog part has no status indication Chapter 5.4 'Digital input' on page 100 16xDC 24V Interrupt functions parameterizable

Analog input > Analog value representation

5.3 Analog input

5.3.1 Properties

- 2xUx12Bit (0 ... 10V) fixed.
- The analog channels of the module are not isolated to the electronic power supply.
- The analog part has no status indication.

Temporarily not used analog inputs must be connected to the concerning ground.

5.3.2 Analog value representation

Number representation in Siemens S7 format

Resolu- tion	Analog value - twos complement															
		High byte (byte 0)					Low byte (byte 1)									
Bit number	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Value	SG	2 ¹⁴	2 ¹³	2 ¹²	2 ¹¹	2 ¹⁰	2 ⁹	2 ⁸	27	2 ⁶	2 ⁵	24	2 ³	2 ²	2 ¹	2 ⁰
11Bit+sign	SG					M	easuring	g value					Х*	Х*	Х*	Х*
*) The lowest value irrelevant bits of the output value (0) are marked with "X".																

Sign bit (SG)	 Here it is essential: Bit 15 = "0": → positive value Bit 15 = "1": → negative value
Behavior at error	As soon as a measured value exceeds the overdrive region respectively falls below the underdrive region, the following value is issued: Measuring value > end of overdrive region: 32767 (7FFFh) Measuring value < end of underdrive region: -32768 (8000h) At a parameterization error the value 32767 (7FFFh) is issued. When leaving the defined range during analog output 0V respectively 0A is issued.

Analog input > Wiring

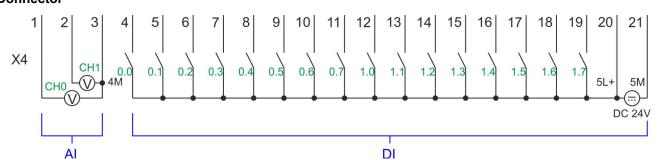

Voltage measurement

0 ... 10V

Measuring range	Voltage	Decimal	Hex	Range	Formulas
	(U)	(D)			
0 10V	> 11.759V	32767	7FFFh	overflow	D 27649 U
	11.759V	32511	7EFFh	overdrive range	$D = 27648 \cdot \frac{U}{10}$
	10V	27648	6C00h	nominal range	10
	5V	13824	3600h		$U = D \cdot \frac{10}{27648}$
	0V	0	0000h		
	-0.8V	-2212	F75Ch	underdrive range	D: decimal value
	< -0.8V	-32768	8000h	underflow	U: voltage value

5.3.3 Wiring

X4	Function	Туре	Description
1	AI 0	I	Al0: Analog input Al 0
2	AI 1	I	AI1: Analog input AI 1
3	Analog 0V	L	4M: GND for analog inputs

Cables for analog signals

For the analog signals you have to use isolated cables. With this the interferences can be reduced. The shield of the analog cables should be grounded at both ends. If there are potential differences between the cables, a potential compensation current can flow, which could disturb the analog signals. In this case, you should only ground the shield at one end of the cable.

Temporarily not used analog inputs must be connected to the concerning ground.

Analog input > Parametrization

5.3.4 Parametrization

5.3.4.1 Adress assignment

Sub module	Input address	Access	Description
AI5/AO2	800	WORD	Analog input channel 0 (X4)
	802	WORD	Analog input channel 1 (X4)

E 2	.4.2	Filter
ວ.ວ	.4.2	Filler

Parameter hardware con-
figurationThe analog input part has a filter integrated. The parametrization of the filter happens in
the Siemens SIMATIC Manager via the parameter 'Integration time'. The default value of
the filter is 1000ms. The following values can be entered:

- 'Input 1 *≙* Channel 1'
 - 'Integration time 2.5ms' ≙ 2ms (no filter)

 - 'Integration time 20ms' ≙1000ms (medium filter)

Parametrization during runtime By using the record set 1 of the SFC 55 "WR_PARM" you may alter the parametrization in the module during runtime.

The time needed until the new parametrization is valid can last up to 2ms. During this time, the measuring value output is 7FFFFh.

Record set 1

Digital input > Parametrization

5.4.3 Parametrization

5.4.3.1 Adress assignment

Sub module	Input address	Access	Description
DI24/DO16	136	BYTE	Digital input I+0.0 I+0.7 (X4)
	137	BYTE	Digital input I+1.0 I+1.7 (X4)

5.4.3.2 Hardware interrupt

Parameter hardware configuration With the parameter *'Hardware interrupt at ...'* you can specify a hardware interrupt for each input for the corresponding edge. The hardware interrupt is disabled, if nothing is selected (default setting). A diagnostics interrupt is only supported with *Hardware interrupt lost*. Select with the arrow keys the input and enable the according hardware interrupts.

Here is valid:

- Rising edge: Edge 0-1
- Falling edge: Edge 1-0

5.4.3.3 Input delay

Parameter hardware configuration

- The input delay can be configured per channel in groups of 4.
- An input delay of 0.1ms is only possible with "fast" inputs, which have a max. input frequency of 100kHz & Chapter 5.4 'Digital input' on page 100. Within a group, the input delay for slow inputs is limited to 0.5ms.
- Range of values: 0.1ms / 0.5ms / 3ms / 15ms

21	0 V	I	5M: GND power section supply for counter

*) Max. input frequency 100kHz otherwise 1kHz.

Input signals

The following sensors can be connected

- 24V incremental encoders with two phase-shifted by 90 ° tracks
- 24V pulse encoder with direction signal
- 24V initiator as BERU or beam sensor

Counting > Wiring

For not all inputs are available at the same time, for every counter you may define the input assignment via the parameterization for the following input signals:

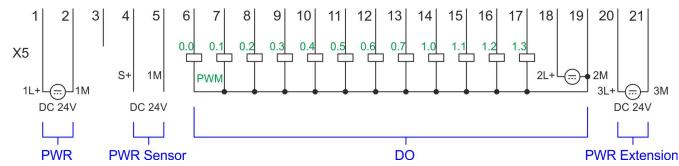

- Counter_x (A)
 - Pulse input for counter signal respectively track A of an encoder for 1-, 2- or 4-fold evaluation.
- Counter_x (B)
 - Direction signal respectively track B of the encoder. Via the parameterization you
 may invert the direction signal.
- Gate 3
 - Via this input you can if parameterized open the HW gate of *Counter 3* with edge 0-1 and start counting.

```
Latch 3
```

 Via this input via edge 0-1 the current counter value of Counter 3 is stored in a memory that you may read if needed.

5.6.2.2 Counter outputs

X5: Connector

X5	Function	Туре	Description
1	Sys DC 24V	I	1L+: DC 24V for electronic section supply
2	Sys 0V	I	1M: GND for electronic section supply
6	DO 0	0	+0.0: Output channel counter 0
7	DO 1	0	+0.1: Output channel counter 1
8	DO 2	0	+0.2: Output channel counter 2
9	DO 3	0	+0.3: Output channel counter 3
18	DC 24V	I	2L+: DC 24V power section supply for on-board counter
19	0 V	I	2M: GND power section supply for on-board counter
20	DC 24V	I	3L+: DC 24V SLIO bus power section supply
21	0 V	I	3M: GND SLIO bus power section supply

Output channel Counter_x

Every counter has an assigned output channel. For each counter you can specify the behavior of the counter output via the parametrization with *'Characteristics of the output'* and *'Pulse duration'*. \Leftrightarrow *Chapter 5.6.4.3 'Counter' on page 108*

5.6.3 Proceeding	
Hardware configuration	In the Siemens SIMATIC Manager the following steps should be executed:
	1. ▶ Perform a hardware configuration for the CPU. <i>♦ Chapter 4.4 'Hardware configura-</i> <i>tion - CPU' on page 65</i>
	 Double-click the counter sub module of the CPU CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
	⇒ The dialog 'Properties' is opened.
	3. As soon as you select the operating mode for the corresponding channel, a dialog box with default values for this counter mode is created and shown.
	4. Perform the required parameter settings.
	5. ▶ Safe your project with 'Station → Safe and compile'.
	6. Transfer your project to your CPU.
User program	 The SFB 47 should cyclically be called (e.g. OB 1) for controlling the counter functions. The SFB is to be called with the corresponding instance DB. Here the parameters of the SFB are stored. Among others the SFB 47 contains a request interface. Hereby you get read and write access to the registers of the appropriate counter. So that a new job may be executed, the previous job must have be finished with JOB_DONE = TRUE. Per channel you may call the SFB in each case with the same instance DB, since the data necessary for the internal operational are stored here. Writing accesses to outputs of the instance DB is not permissible. Starting, stopping and interrupting a count function of <i>Counter 0</i> to <i>Counter 2</i> exclusively happens via the SW gate by setting the SW gate of the SFB 47. You can also activate input <i>'Gate 3'</i> via the parametrization for <i>Counter 3</i>.
	More information about the usage of this block may be found in the manual "SPEED7 Operation List" from VIPA.

5.6.4 Parametrization

5.6.4.1 Address assignment

Sub module	Input address	Access	Description
Counter	816	DINT	Channel 0: Counter value
	820	DINT	Channel 1: Counter value
	824	DINT	Channel 2: Counter value
	828	DINT	Channel 3: Counter value

Counting > Parametrization

Sub module	Output address	Access	Description
Counter	816	DWORD	reserved
	820	DWORD	reserved
	824	DWORD	reserved
	828	DWORD	reserved

5.6.4.2 Interrupt selection

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is disabled.
- Process: The following events of the counter can trigger a hardware interrupt (selectable via 'Count'):
 - Hardware gate opening
 - Hardware gate closing
 - On reaching the comparator
 - on Counting pulse
 - on overflow
 - on underflow
- Diagnostics+process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

5.6.4.3 Counter

Parameter hardware configuration

Default values and structure of this dialog box depend on the selected 'Operating mode'.

Parameter overview

Operating parameters	Description	Assignment
Main count direction	 None No restriction of the counting range Up: Restricts the up-counting range. The counter starts from 0 or <i>load value</i>, counts in positive direction up to the declaration <i>end value</i> -1 and then jumps back to <i>load value</i> at the next positive transducer pulse. Down: Restricts the down-counting range. The counter starts from the declared <i>start value</i> or <i>load value</i> in negative direction, counts to 1 and then jumps to <i>start value</i> at the next negative encoder pulse. Function is disable with <i>count continuously</i>. 	None
Gate function	 <i>Cancel count:</i> The count starts when the gate opens and resumes at the <i>load value</i> when the gate opens again. <i>Stop count:</i> The count is interrupted when the gate closes and resumed at the last actual counter value when the gate opens again. <i>Chapter 5.6.6.2 'Gate function' on page 119</i> 	Abort count process
Start value	Start value with counting direction backward.	2147483647 (2 ³¹ -1)
End value	End value with main counting direction forward.	
	Range of values: 22147483647 (231-1)	
Comparison value	 The count value is compared with the <i>comparison value</i>. See also the parameter "Characteristics of the output": No main counting direction Range of values: -2)³¹ to +2)³¹-1 Main counting direction forward Range of values: -2³¹ to end value-1 Main counting direction backward Range of values: 1 to +2³¹-1 	0
Hysteresis	The <i>hysteresis</i> serves the avoidance of many toggle pro- cesses of the output, if the counter value is in the range of the <i>comparison value</i> . 0, 1: <i>Hysteresis</i> disabled Range of values: 0 to 255	0

Counting > Parametrization

Input	Description	Assignment
Signal evaluation	 Specify the signal of the connected encoder: Pulse/direction At the input count and direction signal are connected At the input there is an encoder connected with the following evaluation: Rotary encoder single Rotary encoder double Rotary encoder quadruple 	Pulse/direction
Hardware gate	 Gate control exclusively via channel 3: enabled: The gate control for channel 3 happens via SW and HW gate disabled: The gate control for channel 3 exclusively happens via SW gate ♦ Chapter 5.6.6.2 'Gate function' on page 119 	disabled
Count direction inverted	 Invert the input signal <i>'Direction'</i>: enabled: The input signal is inverted disabled: The input signal is not inverted 	disabled
Output	Description	Assignment
Characteristics of the output	 The output and the "Comparator" (STS_CMP) status bit are set, dependent on this parameter. No comparison: The output is used as normal output and STS_CMP remains reset. Comparator Counter value ≥ Comparison value Counter value ≤ Comparison value Pulse at <i>comparison value</i> To adapt the used actuators you can specify a <i>pulse duration</i>. The output is set for the specified <i>pulse duration</i> when the counter value reaches the <i>comparison value</i>. When you've set a main counting direction the output is only set at reaching the <i>comparison value</i> from the main counting direction. 	No comparison
Pulse duration	 Here you can specify the <i>pulse duration</i> for the output signal. The <i>pulse duration</i> starts with the setting of the according digital output. The inaccuracy of the <i>pulse duration</i> is less than 1ms. There is no past triggering of the <i>pulse duration</i> when the <i>comparison value</i> has been left and reached again during pulse output. If the <i>pulse duration</i> is changed during operation, it will take effect with the next pulse. If the <i>pulse duration</i> = 0, the output is set until the comparison condition is not longer fulfilled. Range of values: 0510ms in steps of 2ms 	0

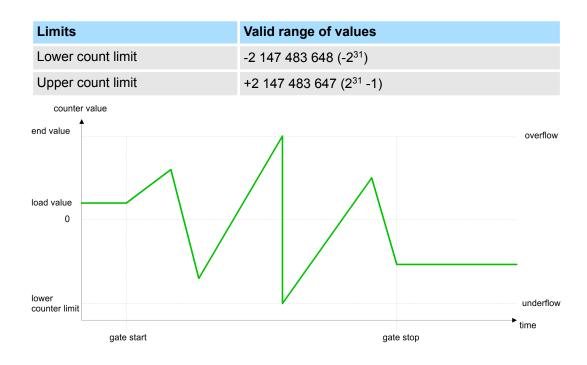

Counting > Parametrization

Hardware interrupt	Description		Assignment
Hardware gate opening	 Hardware interrupt b channel 3 enabled: Process HW gate channe disabled: no hard 	disabled

Counting > Counter operating modes

5.6.5 Counter operating modes

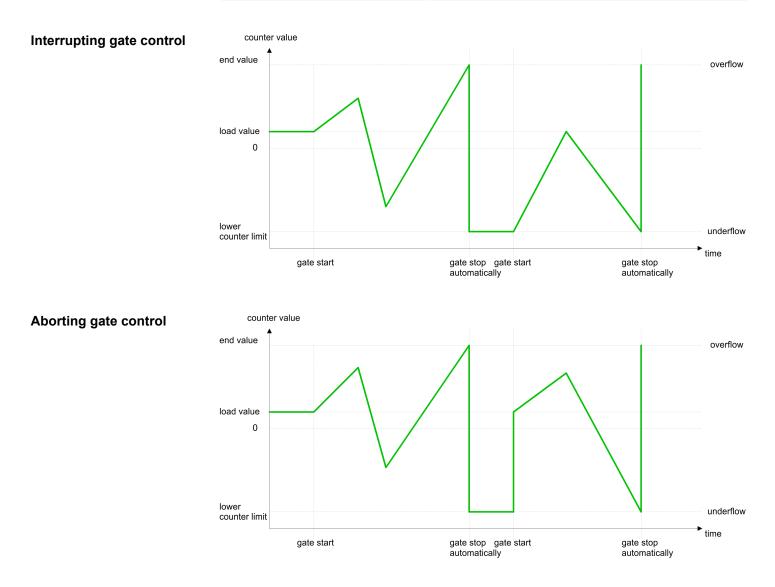

- 5.6.5.1 Count continuously
 - In this operating mode the counter counts starting with the *load value*.
 - When the counter counts forward and reaches the upper count limit and another counting pulse in positive direction arrives, it jumps to the lower count limit and counts from there on.
 - When the counter counts backwards and reaches the lower count limit and another counting pulse in negative direction arrives, it jumps to the upper count limit and counts from there on.
 - The counter limits are fix set to maximum range.
 - With overflow or underflow the status bits STS_OFLW respectively STS_UFLW are set in SFB 47. These bits remain set until these are reset with RES_STS. If enabled additionally a hardware interrupt is triggered.

5.6.5.2 Count once

- 5.6.5.2.1 No main counting direction
 - The counter counts once starting with *load value*.
 - It is counted forward or backward.
 - The counter limits are fix set to maximum range.
 - At over- or underflow at the count limits, the counter jumps to the according other count limit and the gate is automatically closed.
 - To restart the count process, you have to generate an edge 0-1 at the gate 5.6.6.2 'Gate function' on page 119.
 - With the configured 'Gate function' 'Interrupt count' the counting is continued with current Counter value.
 - With configured 'Gate function' 'Cancel count' the counter starts with the Load value.

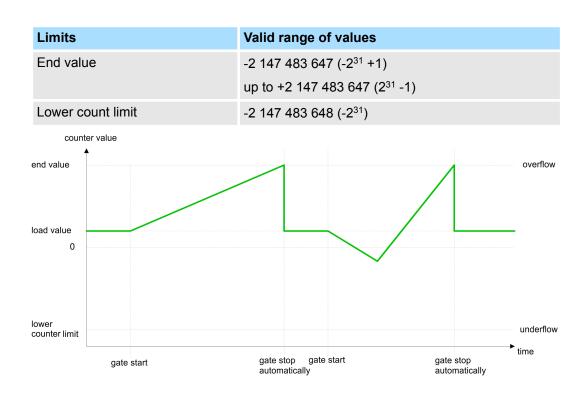

Limits	Valid range of values
Lower count limit	-2 147 483 648 (-2 ³¹)
Upper count limit	+2 147 483 647 (2 ³¹ -1)

Counting > Counter operating modes

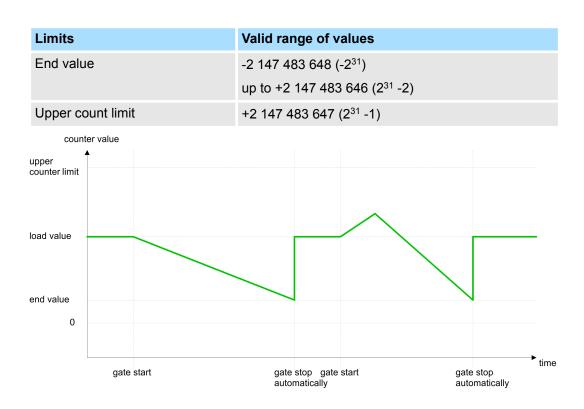

5.6.5.2.2 Main counting direction forward

- The counter counts forward starting with the load value.
- When the counter reaches the End value -1 in positive direction, it jumps to the load value at the next count pulse and the gate is automatically closed.
- To restart the count process, you have to generate an edge 0-1 at the gate 5.6.6.2 'Gate function' on page 119. The counter counts starting with the *load value*.
- You may exceed the lower count limit.

5.6.5.2.3 Main counting direction backward

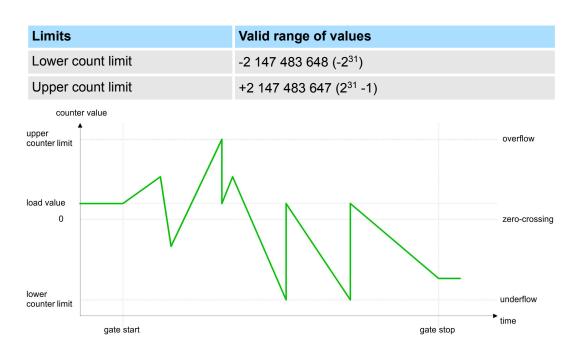

- The counter counts backward starting with the *load value*.
- When the counter reaches the End value +1 in positive direction, it jumps to the load value at the next count pulse and the gate is automatically closed.
- To restart the count process, you have to generate an edge 0-1 at the gate 5.6.6.2 'Gate function' on page 119. The counter counts starting with the *load value*.
- You may exceed the upper count limit.

Counting > Counter operating modes

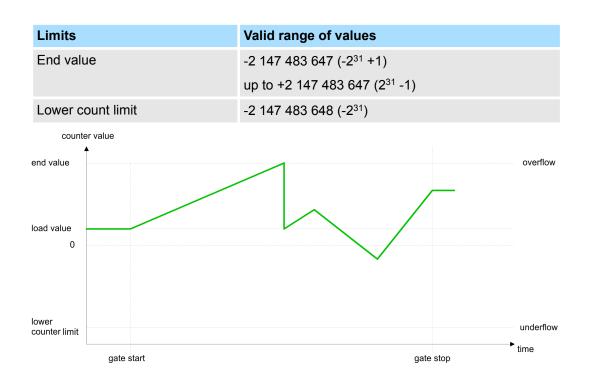

5.6.5.3 Count periodically

- 5.6.5.3.1 No main counting direction
 - The counter counts forward or backwards starting with the *load value*.
 - At over- or underrun at the count limits, the counter jumps to the *load value* and continues counting. If enabled additionally a hardware interrupt is triggered.
 - The counter limits are fix set to maximum range.

5.6.5.3.2 Main counting direction forward

- The counter counts forward starting with the *load value*.
- When the counter reaches the end value -1 in positive direction, it jumps to the *load* value at the next positive count pulse and continues counting. If enabled additionally a hardware interrupt is triggered.
- You may exceed the lower count limit.

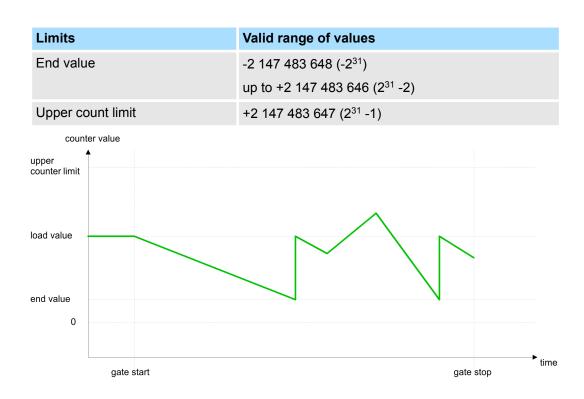

Counting > Counter operating modes

5.6.5.3.3 Main counting direction backward

Main counting direction backward

- The counter counts backward starting with the *load value*.
- When the counter reaches the end value +1 in positive direction, it jumps to the load value at the next negative count pulse and continues counting. If enabled additionally a hardware interrupt is triggered.
- You may exceed the upper count limit.

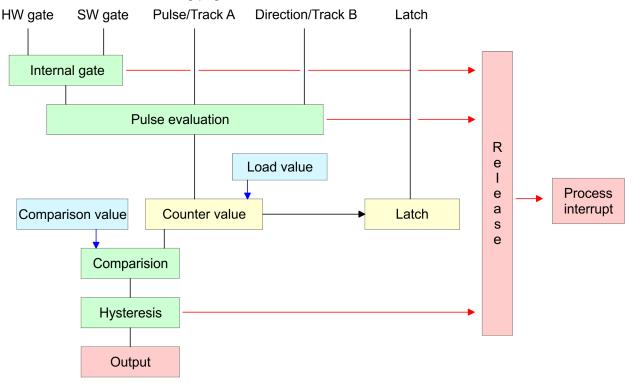

5.6.6 Counter - Additional functions

5.6.6.1 Overview

Schematic structure

The illustration shows how the additional functions influence the counting behavior. The following pages describe these additional functions in detail:

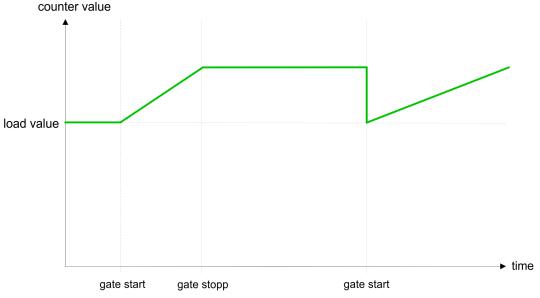

5.6.6.2 Gate function

Function

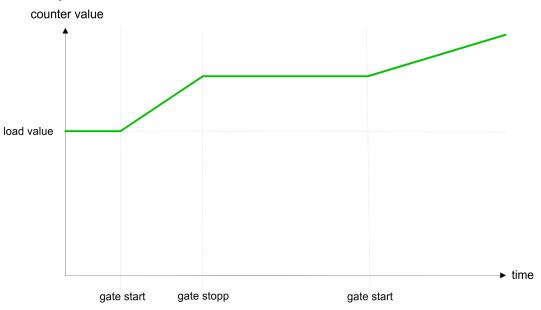

- Starting, stopping and interrupting a count function of *counter 0* to *counter 2* exclusively happens via the SW gate by setting the SW gate of SFB 47.
- Starting, stopping and interrupting a count function of *counter 3* happens via the internal gate (I gate). The i gate is the result of logic operation of HW gate and SW gate. The HW gate evaluation of the connection '*Gate 3*' may be deactivated by the parametrization. With a de-activated HW gate evaluation the triggering exclusively happens by setting the SW gate of SFB 47.

Gate function abort and interrupt The parametrization defines if the gate interrupts or aborts the counter process.

At *abort function* the counter starts counting with the *load value* after gate restart.

At *interrupt function*, the counter starts counting with the last recent counter value after gate restart.

Counter 0 ... 2

SW gate	Gate function	Reaction counter 0 2
Edge 0-1	Abort count process	Restart with load value
Edge 0-1	Interrupt count process	Continue

5.6.6.3 Comparator

Function

In the CPU a *comparison value* may be stored. During the counting procedure the counter value is compared with the *comparative value*. Depending on the result of the comparison the output channel of the counter and the status bit of STS_CMP of SFB 47 can be set. In addition, you can configure a hardware interrupt. A *comparison value* can be specified via the parametrization respectively the job interface of SFB 47.

5.6.6.4 Additional functions counter 3

Exclusively counter 3 has the following additional functions:

- HW gate via Gate 3
- Latch function

5.6.6.4.1 HW gate via Gate 3

Starting, stopping and interrupting a count function of counter 3 happens via the internal gate (I gate). The i gate is the result of logic operation of HW gate and SW gate. The HW gate evaluation of the connection *'Gate 3'* may be deactivated by the parametrization. With a de-activated HW gate evaluation the triggering exclusively happens by setting the SW gate of SFB 47.

Counter 3:

SW gate	HW gate	Gate function	Reaction counter 3:
Edge 0-1	de-activated	Abort count process	Restart with load value
Edge 0-1	de-activated	Interrupt count process	Continue
Edge 0-1	1	Abort count process	Continue
1	Edge 0-1	Abort count process	Restart with load value
Edge 0-1	1	Interrupt count process	Continue
1	Edge 0-1	Interrupt count process	Continue

Counter 3 - count once

If the internal gate has been closed automatically it may only be opened again under the following conditions:			
SW gate	HW gate	l gate	
1	Edge 0-1	1	
Edge 0-1 (after edge 0-1 at HW gate)	Edge 0-1	1	

5.6.6.4.2 Latch function

Function

- As soon as during a count process an edge 0-1 is recognized at the "Latch" input of counter 3, the current counter value is stored in the according latch register.
- You may access the latch value via the parameter LATCHVAL of SFB 47.
- A just in LATCHVAL loaded value remains after a STOP-RUN transition.

5.6.6.5 Counter output channel

Characteristics	of	the
output		

Each counter has an output channel. You pre-define the behavior of the counter output via the parametrization:

- no comparison:
 - The output is used as normal output.
 - SFB 47:
 - The input parameter CTRL_DO is effect less.

The status bits STS_DO and STS_CMP (status comparator in the instance DB) remain reset.

- Counter value ≥ comparison value respectively counter value ≤ comparison value
 - The output remains set as long as the counter value is higher or equal *comparison value* respectively lower or equal *comparison value*.
 - SFB 47:
 - Control bit CTRL_DO must be set.

The comparison result is shown by the status bit STS_CMP. This status bit may only be reset if the comparison condition is no longer fulfilled.

- Pulse at comparison value
 - When the counter reaches the *comparison value* the output is set for the parametrized *pulse duration*. When you've set a main counting direction the output is only set at reaching the *comparison value* from the main counting direction.
 If the *pulse duration* = 0, the output is set until the comparison condition is not longer fulfilled.
 - SFB 47:
 - Control bit CTRL_DO must be set.

The status of the digital output may be shown by the status bit ST_DO. The comparison result is shown by the status bit STS_CMP. The bit may only be

reset if the *pulse duration* has expired.

- Pulse duration
 - The pulse duration starts with the setting of the according digital output.
 - The inaccuracy of the *pulse duration* is less than 1ms.
 - There is no past triggering of the *pulse duration* when the *comparison value* has been left and reached again during pulse output.
 - If the *pulse duration* is changed during operation, it will take effect with the next pulse.
 - If the *pulse duration* = 0, the output is set until the comparison condition is not longer fulfilled.
 - Range of values: 0...510ms in steps of 2ms

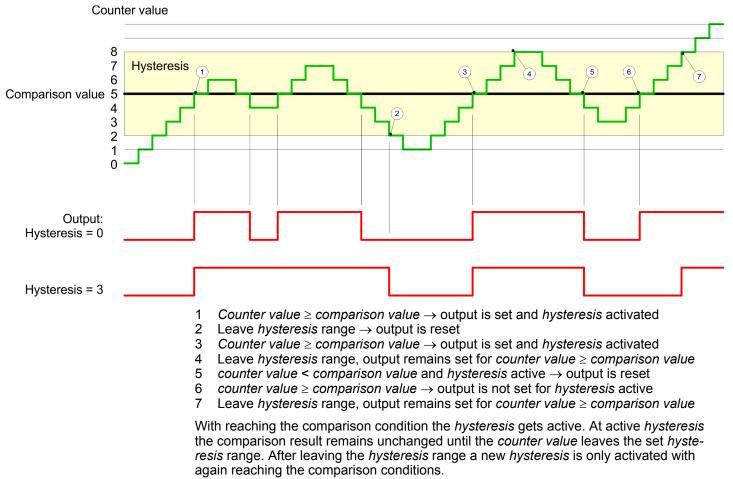

5.6.6.6 Hysteresis function

Hysteresis

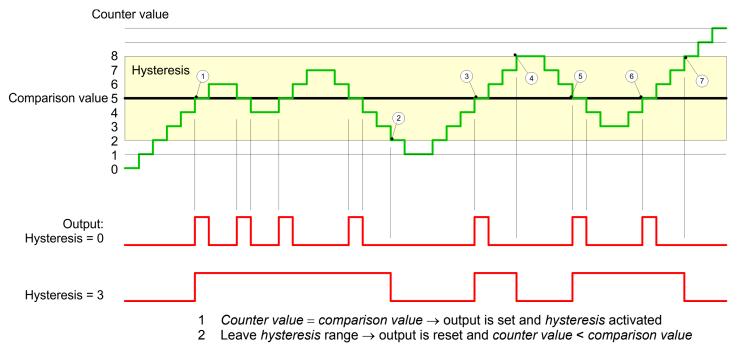

- The hysteresis serves the avoidance of many toggle processes of the output and the interrupt, if the counter value is in the range of the comparison value.
- For the hysteresis you may set a range of 0 to 255.
- The settings 0 and 1 deactivate the hysteresis.
- The *hysteresis* influences zero run, comparison, over- and underflow.
- An activated hysteresis remains active after a change. The new hysteresis range is activated with the next hysteresis event.

The following pictures illustrate the output behavior for *hysteresis* 0 and *hysteresis* 3 for the according conditions:

Effect at counter value ≥ comparison value

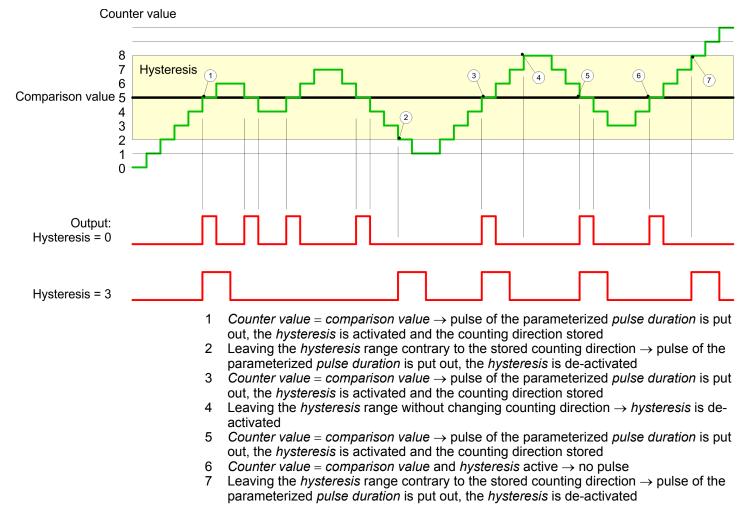

Effect at pulse at comparison value with pulse duration Zero

- 3 Counter value = comparison value \rightarrow output is set and hysteresis activated
- 4 Output is reset for leaving hysteresis range and counter value > comparison value
- 5 Counter value = comparison value \rightarrow output is set and hysteresis activated
- 6 Counter value = comparison value and hysteresis active \rightarrow output remains set
- 7 Leave hysteresis range and counter value > comparison value \rightarrow output is reset

With reaching the comparison condition the *hysteresis* gets active. At active *hysteresis* the comparison result remains unchanged until the *counter value* leaves the set *hysteresis* range. After leaving the *hysteresis* range a new *hysteresis* is only activated with again reaching the comparison conditions.

Effect at pulse at comparison value with pulse duration not zero

With reaching the comparison condition the *hysteresis* gets active and a pulse of the parameterized duration is put out. As long as the *counter value* is within the *hysteresis* range, no other pulse is put out. With activating the *hysteresis* the counting direction is stored in the module. If the *counter value* leaves the *hysteresis* range <u>contrary</u> to the stored counting direction, a pulse of the parameterized duration is put out. Leaving the *hysteresis* range without direction change, no pulse is put out.

Frequency measurement > Properties

5.6.7 Diagnostics and interrupt

Overview

Edge at an digital interrupt input

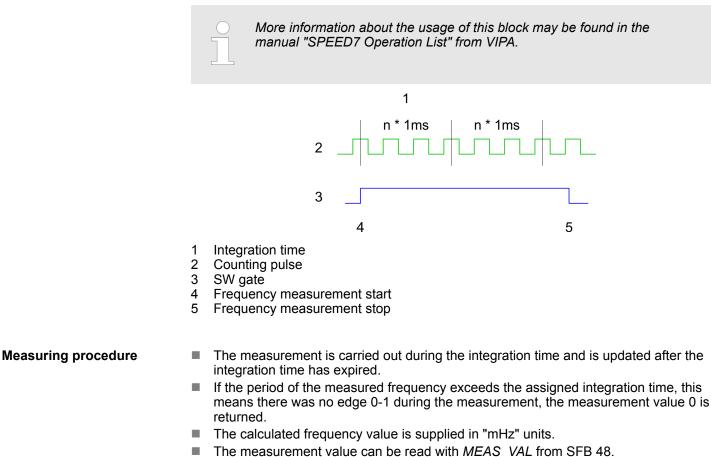

GSDML

Via the hardware configuration you can define the following trigger for a hardware interrupt that can trigger a diagnostics interrupt:

- Reaching the comparison value
- Overflow respectively at overrun upper counter limit
- Underflow respectively at underrun lower counter limit
- Opening the HW gate with open SW gate except for counter 3
- Closing the HW gate with open SW gate except for counter 3

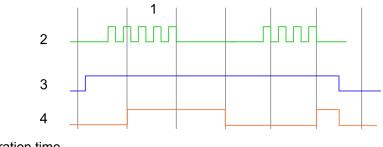

5.7 Frequency measurement

- 5.7.1 Properties
- In this operating mode the CPU counts the incoming pulses during a specified inte-gration time and outputs them as frequency value.
- Integration time 10ms ... 10000ms in steps of 1ms configurable
- Control by the user program via SFB 48

- As long as the SW gate is open, you can request the calculated frequency.
- The number of activated channels does not influence the max. frequency, which is defined in the technical data.

Frequency measurement > Wiring

- Integration time
 Counting pulse
- 2 Counting p 3 SW gate
- 4 Evaluated frequency

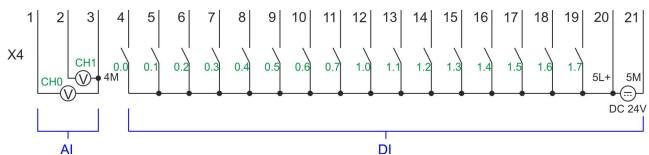

The counting function is disabled during the pulse width modulation on the same channel.

5.7.2 Wiring

5.7.2.1 Frequency measurement inputs

Schließen Sie für die Frequenzmessung das zu messende Signal an den B-Eingang des entsprechenden Zählers an.

X4: Connector

X4	Function	Туре	Description

Frequency measurement > Parametrization

5.7.4.2 Interrupt selection

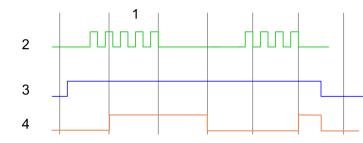

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is de-activated.
- Process: The following events of the frequency measurement can trigger a hardware interrupt (selectable via 'Frequency counting'):
 - End of measurement
- Diagnostics and process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

5.7.4.3 Frequency measurement

Parameter hardware configuration

Default values and structure of this dialog box depend on the selected 'Operating mode'. The following parameters are relevant for frequency measurement, which must be specified or determined:

- 1 Integration time
- 2 Counting pulse
- 3 SW gate
- 4 Evaluated frequency

5.10 Diagnostic and interrupt

5.10.1 Overview

Hardware interrupt

The parametrization allows you to define the following trigger for a hardware interrupt:

- Edge at an digital interrupt input
- Reaching the comparison value
- Overflow respectively at overrun upper counter limit
- Underflow respectively at underrun lower counter limit
- Opening the HW gate with open SW gate except for counter 3
- Closing the HW gate with open SW gate except for counter 3

Diagnostics interrupt The VIPA specific parameters allow you to define the following trigger for a diagnostics interrupt $\stackrel{\scriptstyle\leftarrow}{\Rightarrow}$ Chapter 4.8 'Setting VIPA specific CPU parameters' on page 74:

- Hardware interrupt lost
- Error: 2L+ DC 24V DO power section supply
- Error: 3L+: DC 24V SLIO bus power section supply
- Error: 5L+: DC 24V DI power section supply
- Short circuit overload: Sensor
- Short circuit overload: DO

5.10.2 Process interrupt

An interrupt for the corresponding channel operating mode can only be triggered if you have additionally parameterized 'Diagnostics+Process' at 'Select interrupt' of the 'Basic parameters'.

A process interrupt causes a call of the OB 40. Within the OB 40 you may find the logical basic address of the module that initialized the process interrupt by using the Local word 6. More detailed information about the initializing event is to find in the *local double word* 8. The assignment of *local double word* 8 depends on the parameterized operating mode of each channel.

Local double word 8 of OB 40 at frequency measurement

5.10.3 Diagnostic interrupt

Function

An interrupt for the corresponding channel operating mode can only be triggered if you have additionally parameterized 'Diagnostics+Process' at 'Select interrupt' of the 'Basic parameters'.

Via the parameterization (record set 7Fh) you may activate a global diagnostic interrupt for the module. A diagnostic interrupt occurs when during a process interrupt execution in OB 40 another process interrupt is thrown for the same event. The initialization of a diagnostic interrupt interrupts the recent process interrupt execution in OB 40 and branches in OB 82 to diagnostic interrupt processing_{incoming}. If during the diagnostic interrupt processing other events are occurring at other channels that may also cause a process res. diagnostic interrupt, these are interim stored. After the end of the diagnostic interrupt processing at first all interim stored diagnostic interrupts are processed in the sequence of their occurrence and then all process interrupts. If a channel where currently a diagnostic interrupt_{incoming} is processed res. interim stored initializes further process interrupts, these get lost. When a process interrupt for which a diagnostic interrupt_{incoming} has been released is ready, the diagnostic interrupt processing is called again as diagnostic interruptoutaoing. All events of a channel between diagnostic interruptincoming and diagnostic interruptoutgoing are not stored and get lost. Within this time window (1. diagnostic interrupt_{incoming} until last diagnostic interrupt_{outgoing}) the SF-LED of the CPU is on. Additionally for every diagnostic interruptincoming/outgoing an entry in the diagnostic buffer of the CPU occurs.

Diagnostic interrupt processing

Every OB 82 call causes an entry in the diagnostic buffer of the CPU containing error cause and module address. By using the SFC 59 you may read the diagnostic bytes. At de-activated diagnostic interrupt you have access to the last recent diagnostic event. If you've activated the diagnostic function in your hardware configuration, the contents of record set 0 are already in the local double word 8 when calling the OB 82. The SFC 59 allows you to also read the record set 1 that contains additional information. After leaving the OB 82 a clear assignment of the data to the last diagnostic interrupt is not longer possible. The record sets of the diagnostic range have the following structure:

Record set 0 Diagnostic _{incoming}	Byte	Bit 70
Diagnoonoincoming	0	 Bit 0: set at module failure Counter/Frequency measurement: Process interrupt lost Digital input: Process interrupt lost Missing power supply DI or DO Digital output: short circuit/overload Output Sensor: short circuit/overload SLIO bus: missing supply fieldbus Diagnostic interrupt from SLIO modules Bit 1: set at internal error Missing power supply DI or DO Digital output: short circuit/overload Bit 1: set at internal error Missing power supply DI or DO Digital output: short circuit/overload Output Sensor: short circuit/overload Output Sensor: short circuit/overload Bit 2: set at external error SLIO bus: missing supply fieldbus Bit 3: set at channel error SLIO bus: missing supply fieldbus Bit 4: set at missing external power supply SLIO bus: missing supply fieldbus
	1	 Bit 3 0: Module class 1111b: Digital module or 1000b: Function module Bit 4: Channel information present Counter/Frequency measurement: Process interrupt lost Digital input: Process interrupt lost Missing power supply DI or DO Digital output: short circuit/overload Output Sensor: short circuit/overload SLIO bus: missing supply fieldbus Diagnostic interrupt from SLIO modules
	2	 Bit 3 0: 0 (fix) Bit 4: set at missing internal power supply Missing power supply DI or DO Bit 7 5: 0 (fix)
	3	 Bit 5 0: 0 (fix) Bit 6: Process interrupt lost Bit 7: 0 (fix)

Record set 0 Diagnostic_{outgoing}

After the removing error a diagnostic message_{outgoing} takes place if the diagnostic interrupt release is still active.

Byte	Bit 70
0	 Bit 0: set at module failure Counter/Frequency measurement: Process interrupt lost Digital input: Process interrupt lost Missing power supply DI or DO Digital output: short circuit/overload Output Sensor: short circuit/overload SLIO bus: missing supply fieldbus Diagnostic interrupt from SLIO modules Bit 1: set at internal error Missing power supply DI or DO Digital output: short circuit/overload Bit 1: set at internal error Missing power supply DI or DO Digital output: short circuit/overload Output Sensor: short circuit/overload Output Sensor: short circuit/overload Bit 2: set at external error SLIO bus: missing supply fieldbus Bit 3: set at channel error SLIO bus: missing supply fieldbus Bit 4: set at missing external power supply SLIO bus: missing supply fieldbus Bit 4: set at missing external power supply SLIO bus: missing supply fieldbus

12 15	0 (fix)						

6 Deployment PtP communication

6.1 Fast introduction

General	The CPU has the interface X3 MPI(PtP) with a fix pinout. After an overall reset the inter- face has MPI functionality. By appropriate configuration the PtP function (p oint t o p oint) can be enabled:
	 PtP functionality Using the PtP functionality the RS485 interface is allowed to connect via serial point-to-point connection to different source res. target systems.
Protocols	The protocols respectively procedures ASCII, STX/ETX, 3964R, USS and Modbus are supported.
Parametrization	The parametrization of the serial interface happens during runtime using the FC/SFC 216 (SER_CFG). For this you have to store the parameters in a DB for all protocols except ASCII.
Communication	The FCs/SFCs are controlling the communication. Send takes place via FC/SFC 217 (SER_SND) and receive via FC/SFC 218 (SER_RCV). The repeated call of the FC/SFC 217 SER_SND delivers a return value for 3964R, USS and Modbus via RetVal that contains, among other things, recent information about the acknowledgement of the partner station. The protocols USS and Modbus allow to evaluate the receipt telegram by calling the FC/SFC 218 SER_RCV after SER_SND. The FCs/SFCs are included in the consignment of the CPU.
	 Use FCs instead SFCs Please regard that the special VIPA SFCs are not shown in the SLIO CPU. Please use for programming tools e.g. Siemens SIMATIC Manager and TIA Portal the according FCs of the VIPA library.

Overview FCs/SFCs for serial communication

The following FCs/SFCs are used for the serial communication:

FC/S	SFC	Description
FC/SFC 216	SER_CFG	RS485 parameterize
FC/SFC 217	SER_SND	RS485 send
FC/SFC 218	SER_RCV	RS485 receive

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List" from VIPA.

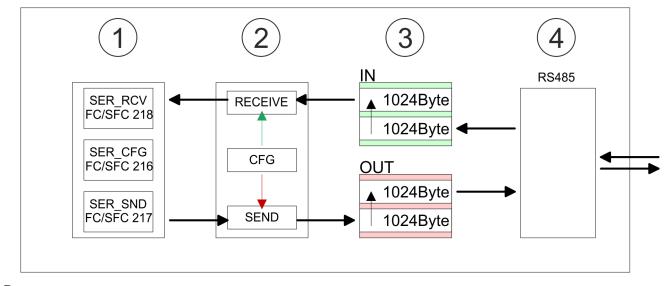

Principle of the data transfer

6.2 Principle of the data transfer

RS485 PtP communication

n The data transfer is handled during runtime by using FC/SFCs. The principle of data transfer is the same for all protocols and is shortly illustrated in the following.

- Data, which are written into the according data channel by the CPU, is stored in a FIFO send buffer (first in first out) with a size of 2x1024byte and then put out via the interface.
- When the interface receives data, this is stored in a FIFO receive buffer with a size of 2x1024byte and can there be read by the CPU.
- If the data is transferred via a protocol, the embedding of the data to the according protocol happens automatically.
- In opposite to ASCII and STX/ETX, the protocols 3964R, USS and Modbus require the acknowledgement of the partner.
- An additional call of the FC/SFC 217 SER_SND causes a return value in RetVal that includes among others recent information about the acknowledgement of the partner.
- Further on for USS and Modbus after a SER_SND the acknowledgement telegram must be evaluated by a call of the FC/SFC 218 SER_RCV.

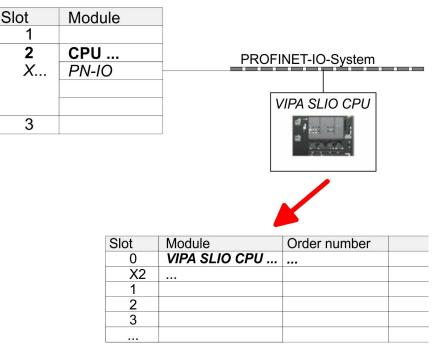

- 1 Program
- 2 Protocol
- 3 FIFO buffer
- 4 Interface

6.3 Enable PtP functionality

Proceeding

After the & Chapter 4.4 'Hardware configuration - CPU' on page 65 of the CPU you can set the parameters of the CPU in the virtual IO device 'VIPA SLIO CPU'.

- 1. Open the properties dialog by a double-click at 'VIPA SLIO CPU'.
 - ⇒ The VIPA specific parameters may be accessed by means of the properties dialog.
- **2.** Select at 'Function X3' the value 'PTP'.
- **3.** Save and transfer your project to the CPU.
 - After a short boot time the interface X3 MPI(PtP) is ready for PtP communication.

Deployment of RS485 interface for PtP

6.4 Deployment of RS485 interface for PtP

Properties RS485

- Logical states represented by voltage differences between the two cores of a twisted pair cable
- Serial bus connection in two-wire technology using half duplex mode
- Data communications up to a max. distance of 500m
- Data communication rate up to 115.2kbaud

Communication > FC/SFC 218 - SER_RCV - Receive from PtP

Connection

- 1 RS485 interface
- 2 Periphery

6.5 Parametrization

6.5.1 FC/SFC 216 - SER_CFG - Parametrization PtP

The parametrization happens during runtime deploying the FC/SFC 216 (SER_CFG). You have to store the parameters for STX/ETX, 3964R, USS and Modbus in a DB.

6.6 Communication

6.6.1 FC/SFC 217 - SER_SND - Send to PtP

This block sends data via the serial interface. The repeated call of the FC/SFC 217 SER_SND delivers a return value for 3964R, USS and Modbus via RETVAL that contains, among other things, recent information about the acknowledgement of the partner station. The protocols USS and Modbus require to evaluate the receipt telegram by calling the FC/SFC 218 SER_RCV after SER_SND.

6.6.2 FC/SFC 218 - SER_RCV - Receive from PtP

This block receives data via the serial interface. Using the FC/SFC 218 SER_RCV after SER_SND with the protocols USS and Modbus the acknowledgement telegram can be read.

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List" from VIPA.

6.7 Protocols and procedures

Overview

The CPU supports the following protocols and procedures:

- ASCII communication
- STX/ETX
- 3964R
- USS
- Modbus

ASCII

ASCII data communication is one of the simple forms of data exchange. Incoming characters are transferred 1 to 1. At ASCII, with every cycle the read FC/SFC is used to store the data that is in the buffer at request time in a parametrized receive data block. If a telegram is spread over various cycles, the data is overwritten. There is no reception acknowledgement. The communication procedure has to be controlled by the concerning user application. For this you can use the FB 1 - Receive_ASCII.

More information about the usage of this block may be found in the manual "SPEED7 Operation List" from VIPA.

STX/ETX

STX/ETX is a simple protocol with start and end ID, where STX stands for **S**tart of **Text** and ETX for **E**nd of **Text**.

- Any data transferred from the periphery must be preceded by a Start followed by the data characters and the end character. Depending of the byte width the following ASCII characters can be transferred: 5bit: not allowed: 6bit: 20...3Fh, 7bit: 20...7Fh, 8bit: 20...FFh.
- The effective data, which includes all the characters between Start and End are transferred to the CPU when the End has been received.
- When data is send from the CPU to a peripheral device, any user data is handed to the FC/SFC 217 (SER_SND) and is transferred with added Start- and End-ID to the communication partner.
- You may work with 1, 2 or no Start- and with 1, 2 or no End-ID.
- If no End-ID is defined, all read characters are transferred to the CPU after a parameterizable character delay time (Timeout).

As Start-res. End-ID all Hex values from 01h to 1Fh are permissible. Characters above 1Fh are ignored. In the user data, characters below 20h are not allowed and may cause errors. The number of Start- and End-IDs may be different (1 Start, 2 End res. 2 Start, 1 End or other combinations). For not used start and end characters you have to enter FFh in the hardware configuration.

Message structure:

3964

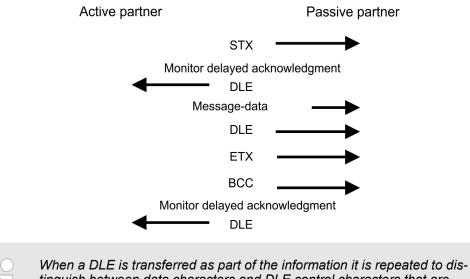

The 3964R procedure controls the data transfer of a point-to-point link between the CPU and a communication partner. The procedure adds control characters to the message data during data transfer. These control characters may be used by the communication partner to verify the complete and error free receipt.

The procedure employs the following control characters:

- STX: Start of Text
- DLE: Data Link Escape
- ETX: End of Text
- BCC: Block Check Character
- NAK: Negative Acknowledge

You may transfer a maximum of 255byte per message.

Procedure

When a DLE is transferred as part of the information it is repeated to distinguish between data characters and DLE control characters that are used to establish and to terminate the connection (DLE duplication). The DLE duplication is reversed in the receiving station.

The 3964R procedure <u>requires</u> that a lower priority is assigned to the communication partner. When communication partners issue simultaneous send commands, the station with the lower priority will delay its send command.

USS

The USS protocol (**U**niverselle **s**erielle **S**chnittstelle = universal serial interface) is a serial transfer protocol defined by Siemens for the drive and system components. This allows to build-up a serial bus connection between a superordinated master and several slave systems. The USS protocol enables a time cyclic telegram traffic by presetting a fix telegram length.

The following features characterize the USS protocol:

- Multi point connection
- Master slave access procedure
- Single master system
- Max. 32 participants
- Simple and secure telegram frame

It is essential:

- You may connect 1 master and max. 31 slaves at the bus
- The single slaves are addressed by the master via an address sign in the telegram.

Protocols and procedures

- The communication happens exclusively in half-duplex operation.
- After a send command, the acknowledgement telegram must be read by a call of the FC/SFC 218 SER_RCV.

The telegrams for send and receive have the following structure:

Master slave telegram

STX	LGE	ADR	PKE		IND		PWE		STW		HSW		BCC
02h			Н	L	Н	L	Н	L	Н	L	Н	L	

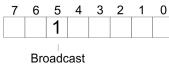

Slave master telegram

STX	LGE	ADR	PKE		IND		PWE		ZSW		HIW		BCC
02h			Н	L	Н	L	Н	L	Н	L	Н	L	

	with
	STX - Start sign
	STW - Control word
	LGE - Telegram length
	ZSW - State word
	ADR - Address
	HSW - Main set value
	PKE - Parameter ID
	HIW - Main effective value
	IND - Index

- BCC Block Check Character
- PWE Parameter value

Broadcast with set bit 5 in ADR byte

A request can be directed to a certain slave ore be send to all slaves as broadcast message. For the identification of a broadcast message you have to set bit 5 to 1 in the ADR byte. Here the slave addr. (bit 0 ... 4) is ignored. In opposite to a "normal" send command, the broadcast does not require a telegram evaluation via FC/SFC 218 SER_RCV. Only write commands may be sent as broadcast.

Modbus

- The Modbus protocol is a communication protocol that fixes a hierarchic structure with one master and several slaves.
- Physically, Modbus works with a serial half-duplex connection. There are no bus conflicts occurring, because the master can only communicate with one slave at a time.
- After a request from the master, this waits for a preset delay time for an answer of the slave. During the delay time, communication with other slaves is not possible.
- After a send command, the acknowledgement telegram must be read by a call of the FC/SFC 218 SER_RCV.
- The request telegrams send by the master and the respond telegrams of a slave have the following structure:

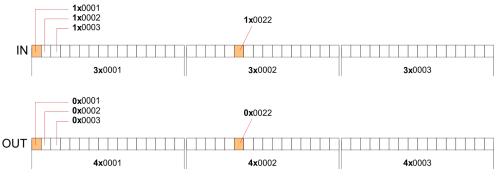

Start sign	Slave address	Function Code	Data	Flow control	End sign		
Broadcast with slave address = 0		 A request can be directed to a special slave or at all slaves as broadcast message. To mark a broadcast message, the slave address 0 is used. In opposite to a "normal" send command, the broadcast does not require a telegram evaluation via FC/SFC 218 SER_RCV. Only write commands may be sent as broadcast. 					
using the FC/SF ASCII mode: with a start a RTU mode: I		ASCII mode: E with a start and RTU mode: Ev	ifferent transfer modes. The mode s 216 SER_CFG. Every byte is transferred in the 2 sig d an end sign. This causes a transp very byte is transferred as one chara as the ASCII mode. Instead of start	n ASCII code. The arent but slow trar acter. Supported Mod cols	lbus proto-	The following Mod Modbus RTU M Modbus ASCII		RS485 interface:			

6.8 Modbus - Function codes

Naming convention	Modbus has some naming conventions:				
	Bit = IN: "Input Status" Coil OUT: "Coil Status"				
	Word = IN: "Input Register" Register OUT: "Holding Register"				
	Modbus differentiates between bit and word access; bits = "Coils" and words = "Register".				
	 Bit inputs are referred to as "Input-Status" and bit outputs as "Coil-Status". word inputs are referred to as "Input-Register" and word outputs as "Holding-Register". 				
Range definitions	Normally the access at Modbus happens by means of the ranges 0x, 1x, 3x and 4x.				
	0x and 1x gives you access to digital bit areas and 3x and 4x to analog word areas.				
	For the CPs from VIPA is not differentiating digital and analog data, the following assign- ment is valid:				

- 0x Bit area for master output data Access via function code 01h, 05h, 0Fh
- 1x Bit area for master input data Access via function code 02h
- 3x word area for master input data Access via function code 04h
- 4x word area for master output data

Access via function code 03h, 06h, 10h

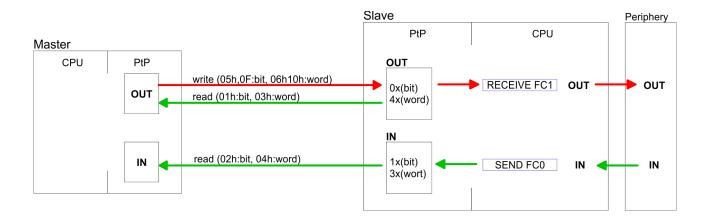

Overview

With the following Modbus function codes a Modbus master can access a Modbus slave: With the following Modbus function codes a Modbus master can access a Modbus slave. The description always takes place from the point of view of the master:

Code	Command	Description
01h	Read n bits	Read n bits of master output area 0x
02h	Read n bits	Read n bits of master input area 1x
03h	Read n words	Read n words of master output area 4x
04h	Read n words	Read n words master input area 3x
05h	Write 1 bit	Write 1 bit to master output area 0x
06h	Write 1 word	Write 1 word to master output area 4x
0Fh	Write n bits	Write n bits to master output area 0x
10h	Write n words	Write n words to master output area 4x

Point of View of "Input" and "Output" data

The description always takes place from the point of view of the master. Here data, which were sent from master to slave, up to their target are designated as "output" data (OUT) and contrary slave data received by the master were designated as "input" data (IN).

Respond of the slave	If the slave announces an error, the function code is send back with an "ORed" 80h.
	Without an error, the function code is sent back.

Slave answer:	Function code OR 80h	\rightarrow Error
	Function code	$\rightarrow OK$

Byte sequence in a word	1 word
	High-byte Low-byte

Check sum CRC, RTU, LRC	The shown check sums CRC at RTU and LRC at ASCII mode are automatically added to every telegram. They are not shown in the data block.
Read n bits 01h, 02h	Code 01h: Read n bits of master output area 0x

Code 02h: Read n bits of master input area 1x

Command telegram

Slave address	Function code	Address 1. bit	Number of bits	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Respond telegram

Slave address	Function code	Number of read bytes	Data 1. byte	Data 2. byte	 Check sum CRC/LRC
1byte	1byte	1byte	1byte	1byte	1word
				max. 250byte	

Read n words 03h, 04h

03h: Read n words of master output area 4x 04h: Read n words master input area 3x

Deployment PtP communication

Modbus - Function codes

Command telegram

Slave address	Function code	Address 1. bit	Number of words	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Respond telegram

1byte	1byte	1byte	1word	1word	1word
				max. 125words	

Write 1 bit 05h	Code 05h: Write 1 bit to master output area 0x
	A status change is via "Status bit" with following values:
	"Status bit" = 0000h \rightarrow Bit = 0
	"Status bit" = FF00h \rightarrow Bit = 1

Command telegram

Slave address	Function code	Address bit	Status bit	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Respond telegram

Slave address	Function code	Address bit	Status bit	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Write 1 word 06hCode 06h: Write 1 word to master output area 4x

Command telegram

Slave address	Function code	Address word	Value word	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Respond telegram

Slave address	Function code	Address word	Value word	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Write n bits 0Fh

Code 0Fh: Write n bits to master output area 0x

Please regard that the number of bits has additionally to be set in byte.

Command telegram

Slave address	Function code	Address 1. bit	Number of bits	Number of bytes	Data 1. byte	Data 2. byte		Check sum CRC/LRC
1byte	1byte	1word	1word	1byte	1byte	1byte	1byte	1word
					r	max. 250byte		

Respond telegram

Slave address	Function code	Address 1. bit	Number of bits	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

Write n words 10h Code 10h: Write n words to master output area 4x

Command telegram

Slave address	Function code	Address 1. word	Number of words	Number of bytes	Data 1. word	Data 2. word		Check sum CRC/LRC
1byte	1byte	1word	1word	1byte	1word	1word	1word	1word
					r	nax. 125words	;	

Respond telegram

Slave address	Function code	Address 1. word	Number of words	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

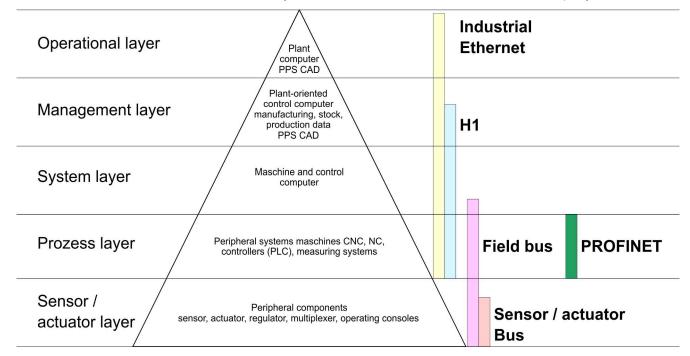

Basics - Industrial Ethernet in automation

7 Deployment PG/OP communication - productive

7.1 Basics - Industrial Ethernet in automation

Overview

The flow of information in a company presents a vast spectrum of requirements that must be met by the communication systems. Depending on the area of business the bus system or LAN must support a different number of users, different volumes of data must be transferred and the intervals between transfers may vary, etc. It is for this reason that different bus systems are employed depending on the respective task. These may be subdivided into different classes. The following model depicts the relationship between the different bus systems and the hierarchical structures of a company:

Industrial Ethernet

Industrial Ethernet is an electrical net based on shielded twisted pair cabling or optical net based on optical fibre. Industrial Ethernet is defined by the international standard IEEE 802.3

The net access of Industrial Ethernet corresponds to IEEE 802.3 - CSMA/CD (**C**arrier **S**ense **M**ultiple **A**ccess/**C**ollision **D**etection) scheme:

- Every station "listens" on the bus cable and receives communication messages that are addressed to it.
- Stations will only initiate a transmission when the line is unoccupied.
- In the event that two participants should start transmitting simultaneously, they will detect this and stop transmitting to restart after a random delay time has expired.
- Using switches there is the possibility for communication without collisions.

7.2 Basics - ISO/OSI reference model

Overview	The ISO/OSI reference model is based on a proposal that was developed by the Interna- tional Standards Organization (ISO). This represents the first step towards an interna- tional standard for the different protocols. It is referred to as the ISO-OSI layer model. OSI is the abbreviation for O pen S ystem Interconnection, the communication between open systems. The ISO/OSI reference model does not represent a network architecture as it does not define the services and protocols used by the different layers. The model simply specifies the tasks that the different layers must perform. All current communication sys- tems are based on the ISO/OSI reference model, which is defined by the ISO 7498 standard. The reference model structures communication systems into 7 layers that cover different communication tasks. In this manner the complexity of the communication between different systems is divided amongst different layers to simplify the task.
	The following layers have been defined:
	 Layer 7 - Application Layer Layer 6 - Presentation Layer Layer 5 - Session Layer Layer 4 - Transport Layer Layer 3 - Network Layer Layer 2 - Data Link Layer Layer 1- Physical Layer
	Depending on the complexity and the requirements of the communication mechanisms a communication system may use a subset of these layers.
Layer 1 - Bit communica- tion layer (physical layer)	The bit communication layer (physical layer) is concerned with the transfer of data bits via the communication channel. This layer is therefore responsible for the mechanical, electrical and the procedural interfaces and the physical communication medium located below the bit communication layer:
	 Which voltage represents a logical 0 or a 1? The minimum time the voltage is present to be recognized as a bit. The pin assignment of the respective interface.
Layer 2 - Security layer (data link layer)	This layer performs error-checking functions for bit strings transferred between two com- municating partners. This includes the recognition and correction or flagging of communi- cation errors and flow control functions. The security layer (data link layer) converts raw communication data into a sequence of frames. This is where frame limits are inserted on the transmitting side and where the receiving side detects them. These limits consist of special bit patterns that are inserted at the beginning and at the end of every frame. The security layer often also incorporates flow control and error detection functions. The data security layer is divided into two sub-levels, the LLC and the MAC level. The MAC (Media Access Control) is the lower level and controls how senders are sharing a single transmit channel. The LLC (Logical Link Control) is the upper level that establishes the connection for transferring the data frames from one device into the other.
Layer 3 - Network layer	The network layer is an agency layer. Business of this layer is to control the exchange of binary data between stations that are not directly connected. It is responsible for the log- ical connections of layer 2 communications. Layer 3 supports the identification of the single network addresses and the establishing and disconnecting of logical communica- tion channels. Additionally, layer 3 manages the prior transfer of data and the error pro- cessing of data packets. IP (Internet Protocol) is based on Layer 3.
Layer 4 - Transport layer	Layer 4 connects the network structures with the structures of the higher levels by dividing the messages of higher layers into segments and passes them on to the network layer. Hereby, the transport layer converts the transport addresses into network addresses. Common transport protocols are: TCP, SPX, NWLink and NetBEUI.

Basics - Terms	
Layer 5 - Session layer	The session layer is also called the communication control layer. It relieves the communi- cation between service deliverer and the requestor by establishing and holding the con- nection if the transport system has a short time fail out. At this layer, logical users may communicate via several connections at the same time. If the transport system fails, a new connection is established if needed. Additionally this layer provides methods for con- trol and synchronization tasks.
Layer 6 - Presentation layer	This layer manages the presentation of the messages, when different network systems are using different representations of data. Layer 6 converts the data into a format that is acceptable for both communication partners. Here compression/decompression and encrypting/decrypting tasks are processed. This layer is also called interpreter. A typical use of this layer is the terminal emulation.
Layer 7 - Application layer	The application layer is the link between the user application and the network. The tasks of the application layer include the network services like file, print, message, data base and application services as well as the according rules. This layer is composed from a series of protocols that are permanently expanded following the increasing needs of the user.
7.3 Basics - Terms	
Network (LAN)	A network res. LAN (Local Area Network) provides a link between different stations that enables them to communicate with each other. Network stations consist of PCs, IPCs, TCP/IP adapters, etc. Network stations are separated by a minimum distance and con- nected by means of a network cable. The combination of network stations and the net- work cable represent a complete segment. All the segments of a network form the Ethernet (physics of a network).
Twisted Pair	In the early days of networking the Triaxial- (yellow cable) or thin Ethernet cable (Cheap- ernet) was used as communication medium. This has been superseded by the twisted- pair network cable due to its immunity to interference. The CPU has a twisted-pair con- nector. The twisted-pair cable consists of 8 cores that are twisted together in pairs. Due to these twists this system is provides an increased level of immunity to electrical interfer- ence. For linking please use twisted pair cable which at least corresponds to the category 5. Where the coaxial Ethernet networks are based on a bus topology the twisted-pair net- work is based on a point-to-point scheme. The network that may be established by means of this cable has a star topology. Every station is connected to the star coupler (hub/switch) by means of a separate cable. The hub/switch provides the interface to the Ethernet.
Hub (repeater)	The hub is the central element that is required to implement a twisted-pair Ethernet net- work. It is the job of the hub to regenerate and to amplify the signals in both directions. At the same time it must have the facility to detect and process segment wide collisions and to relay this information. The hub is not accessible by means of a separate network address since it is not visible to the stations on the network. A hub has provisions to inter- face to Ethernet or to another hub res. switch.
Switch	A switch also is a central element for realizing Ethernet on Twisted Pair. Several stations res. hubs are connected via a switch. Afterwards they are able to communicate with each other via the switch without interfering the network. An intelligent hardware analyses the incoming telegrams of every port of the switch and passes them collision free on to the destination stations of the switch. A switch optimizes the bandwidth in every connected segment of a network. Switches enable exclusive connections between the segments of a network changing at request.

7.4 Basics - Protocols

Overview

Protocols define a set of instructions or standards that enable computer to establish communication connections and exchange information as error free as possible. A commonly established protocol for the standardization of the complete computer communication is the so called ISO/OSI layer model, a model based upon seven layers with rules for the usage of hardware and software *Chapter 7.2 'Basics - ISO/OSI reference model' on page 161*

The following protocols are used:

- Siemens S7 connections
- Open communication
 - TCP native according to RFC 793
 - ISO on TCP according to RFC 1006
 - UDP according to RFC 768

Siemens S7 connections With the Siemens S7 connection large data sets may be transferred between PLC systems based on Siemens STEP[®]7. Here the stations are connected via Ethernet. Precondition for the Siemens S7 communication is a configured connection table, which contains the defined connections for communication. Here NetPro from Siemens may be used.

Properties:

- A communication connection is specified by a connection ID for each connection partner.
- The acknowledgement of the data transfer is established from the partner station at level 7 of the ISO/OSI reference model.
- At the PLC side FB/SFB VIPA handling blocks are necessary for data transfer for the Siemens S7 connections.

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List" from VIPA.

Basics - IP address and subnet

Open communication In the *'open communication'* the communication takes place via the user program by means of handling blocks. These blocks are also part of the Siemens SIMATIC Manager. You will find these in the 'Standard Library' at 'Communication Blocks'. Connection-oriented protocols: Connection-oriented protocols establish a (logical) connection to the communication partner before data transmission is started. And if necessary they terminate the connection after the data transfer was finished. Connection-oriented protocols are used for data transmission when reliable, guaranteed delivery is of particular importance. In general, many logical connections can exist on one physical line. The following connection-oriented protocols are supported with FBs for open communication via Industrial Ethernet: TCP native accord. to RFC 793: During data transmission, no information about the length or about the start and end of a message is transmitted. However, the receiver has no means of detecting where one message ends in the data stream and the next one begins. The transfer is stream-oriented. For this reason, it is recommended that the data length of the FBs is identical for the sending and receiving station. If the number of received data does not fit to the preset length you either will get not the whole data, or you will get data of the following job. ISO on TCP accord, to RFC 1006: During data transmission, information on the length and the end of the message is also transmitted. If you have specified the length of the data to be received greater than the length of the data to be sent, the receive block will copy the received data completely into the receive range. Connection-less protocol: There is thus no establishment and termination of a connection with a remote partner. Connection-less protocols transmit data with no acknowledge and with no reliable guaranteed delivery to the remote partner. UDP accord. to RFC 768: In this case, when calling the sending block you have to specify the address parameters of the receiver (IP address and port number). During data transmission, information on the length and the end of the message is also transmitted. In order to be able to use the sending and receiving blocks first you have to configure the local communications access point at both sides. With each new call of the sending block, you re-reference the remote partner by specifying its IP address and its port number. 7.5 Basics - IP address and subnet IP address structure Exclusively IPv4 is supported. At IPv4 the IP address is a 32bit address that must be

	unique within the network and consists of 4 numbers that are separated by a dot. Every IP address is a combination of a <i>Net-ID</i> and a <i>Host-ID</i> and has the following
	Structure: xxx.xxx.xxx
	Range: 000.000.000 to 255.255.255
Net-ID, Host-ID	The Net work-ID identifies a network res. a network controller that administrates the net- work. The Host-ID marks the network connections of a participant (host) to this network.
Subnet mask	The Host-ID can be further divided into a <i>Subnet-ID</i> and a new <i>Host-ID</i> by using a bit for bit AND assignment with the Subnet mask.
	The area of the original Host-ID that is overwritten by 1 of the Subnet mask becomes the Subnet-ID, the rest is the new Host-ID.

Basics - IP address and subnet

Subnet mask	binary all "1"		binary all "0"
IPv4 address	Net-ID	Host-ID	
Subnet mask and IPv4 address	Net-ID	Subnet-ID	new Host-ID

 Address at first start-up
 At the first start-up of the CPU, the Ethernet PG/OP channel does not have an IP address.

 Information about the assignment of IP address data to the Ethernet PG/OP channel may be found in S Chapter 4.6 'Hardware configuration - Ethernet PG/OP channel'

Address classes For IPv4 addresses there are five address formats (class A to class E) that are all of a length of 4byte = 32bit.

on page 68.

Class A	0 Network-ID (1+7bit)		Host-ID (24bit)			
Class B	10 Networ		work-ID (2+14bit)	(2+14bit) Host-ID		(16bit)
Class C	110 Ne		Network-ID (3+21bit)			Host-ID (8bit)
Class D	1110 I		Multicast group			
Class E	11110		Reserved			

The classes A, B and C are used for individual addresses, class D for multicast addresses and class E is reserved for special purposes. The address formats of the 3 classes A, B, C are only differing in the length of Network-ID and Host-ID.

Private IP networks These addresses can be used as net-ID by several organizations without causing conflicts, for these IP addresses are neither assigned in the Internet nor are routed in the Internet. To build up private IP-Networks within the Internet, RFC1597/1918 reserves the following address areas:

Network class	from IP	to IP	Standard subnet mask	
A	10. <u>0.0.0</u>	10. <u>255.255.255</u>	255. <u>0.0.0</u>	
В	172.16. <u>0.0</u>	172.31. <u>255.255</u>	255.255. <u>0.0</u>	
С	192.168.0. <u>0</u>	192.168.255. <u>255</u>	255.255.255. <u>0</u>	
(The Host-ID is underlined.)				

Reserved Host-IDs

Some Host-IDs are reserved for special purposes.

Host-ID = "0"	Identifier of this network, reserved!
Host-ID = maximum (binary complete "1")	Broadcast address of this network

Configure Siemens S7 connections

7.6 Fast introduction

Overview	At the first commissioning respectively after an overall reset with PowerON again of the CPU, the Ethernet PG/OP channel has no IP address. This can only be reached by its MAC address. By means of the MAC address, which is printed at the front as <i>'MAC PG/OP:'</i> , you can assign IP address data. The assignment takes place directly via the hardware configuration of the Siemens SIMATIC Manager.		
Steps of configuration	For the configuration of the Ethernet PG/OP channel for productive connections please follow the following approach:		
	 Hardware configuration - CPU Hardware configuration - Ethernet PG/OP channel Configure connections Siemens S7 connections (Configuration via Siemens NetPro, communication via VIPA handling blocks) Open communication 		

- (Configuration and communication happens by standard handling blocks)
- Transfer of the complete project to CPU

In the Siemens SIMATIC Manager, the CPU 013-CCF0R00 from VIPA is to be configured as CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)!

The Ethernet PG/OP channel of the CPU 013-CCF0R00 is always to be configured as CP343-1 (343-1EX30 V3.0) from Siemens at slot 4.

7.7 Hardware-Konfiguration

Overview

At the first commissioning respectively after an overall reset with PowerON again of the CPU, the Ethernet PG/OP channel has no IP address. This can only be reached by its MAC address. By means of the MAC address, which is printed at the front as *'MAC PG/OP:...'*, you can assign IP address data. The assignment takes place directly via the hardware configuration of the Siemens SIMATIC Manager.

 Ethernet PG/OP channel

Schapter 4.6 'Hardware configuration - Ethernet PG/OP channel' on page 68

7.8 Configure Siemens S7 connections

Overview

The project engineering of connections i.e. the "link-up" between stations happens in NetPro from Siemens. NetPro is a graphical user interface for the link-up of stations. A communication connection enables the program controlled communication between two participants at the Industrial Ethernet. The communication partners may here be part of

Configure Siemens S7 connections

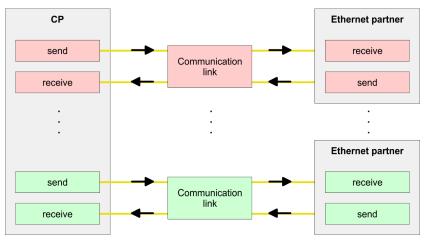

the same project or - at multi projects - separated within related part projects. Communication connections to partners outside of a project are configured via the object "In unknown project" or via deputy objects like "Other stations" or Siemens "SIMATIC S5 Station". The communication is controlled by the user program with VIPA handling blocks. To use this blocks, configured communication connections are always necessary in the active station.

- ♦ 'Link-up stations' on page 168
- & 'Projecting connections' on page 169
- & 'Siemens S7 connection Communication functions' on page 171

Properties communication connection

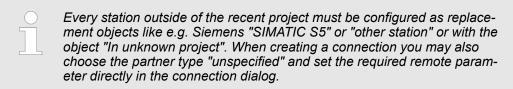

The following properties are characterizing a communication connection:

- One station always executes an active connection establishment.
- Bi-directional data transfer (Send and receive on one connection)
- Both participant have equal rights, i.e. every participant may initialize the send res. receive process event controlled.
- Except of the UDP connection, at a communication connection the address of the communication partner is set via the project engineering. Here the connection is active established by one station.

Requirements

Siemens SIMATIC Manager V 5.5 SP2 or higher and SIMATIC NET are installed.
 With the hardware configuration the according CP was assigned with IP address data by its properties.

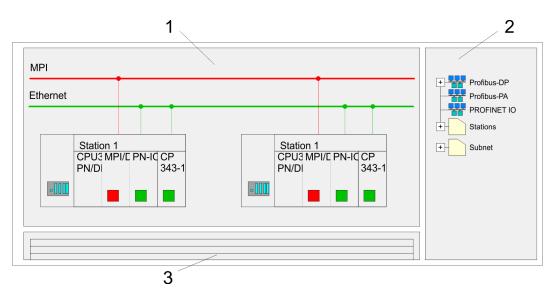

Work environment of NetPro

For the project engineering of connections, a thorough knowledge with NetPro from Siemens is required! The following passage only describes the basic usage of NetPro. More detailed information about NetPro is to be found in the according online manual res. documentation. Start NetPro by clicking on a "net" in the Siemens SIMATIC Manager or on "connections" within the CPU.

The environment of NetPro has the following structure:

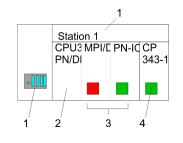

Deployment PG/OP communication - productive

Configure Siemens S7 connections

- 1 *Graphic net view:* All stations and networks are displayed in a graphic view. By clicking on the according component you may access and alter the concerning properties.
- 2 *Net objects:* This area displays all available net objects in a directory view. By dragging a wanted object to the net view you may include further net objects and open them in the hardware configurator.
- 3 *Connection table:* The connection table lists all connections in a table. This list is only shown when you highlighted a connectable module like e.g. a CPU. You may insert new connections into this table with the according command.

PLC stations

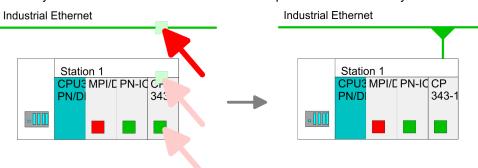

You receive the following graphical display for every PLC station and their component. By selecting the single components, the context menu offers you several functions:

- 1 *Station:* This includes a PLC station with rack, CPU and communication components. Via the context menu you may configure a station added from the net objects and its concerning components in the hardware configurator. After returning to NetPro, the new configured components are shown.
- 2 *CPU:* A click onto the CPU shows the connection table. The connection table shows all connections that are configured for the CPU.
- 3 Internal communication components: This displays the communication components that are available in your CPU. The PROFINET IO controller is to be configured by the PN-IO component.
- 4 *Ethernet PG/OP channel:* The internal Ethernet PG/OP channel must always be configured as external CP in the hardware configuration.

Link-up stations

NetPro offers you the option to link-up the communicating stations. You may link-up the stations via the properties in the hardware configuration or graphically via NetPro. For this you point the mouse on the coloured net mark of the according CP and drag and drop it to the net you want to link. Now the CP is linked up to the wanted net by means of a line.

Projecting connections

Projecting connections

	Station 1 CPU3 MPI/C PI PN/DI	N-IC CP 343-1
-110		
		insert new connection

- **1.** For the project engineering of connections, open the connection list by selecting the according CPU. Choose *Insert new connection* in the context menu:
 - Connection partner (partner station)
 A dialog window opens where you may choose the connection partner and the connection type.
 - Specified connection partner Each station configured in the Siemens SIMATIC Manager is listed in the table of connection partner. These stations are unique specified by an IP address and a subnet mask.
 - Unspecified connection partner

Here the connection partner may exist in the *current project* or in an unknown project. Connection jobs to an *unknown project* must be defined by an unique connection name, which is to be used in the projects of both stations. Due to this allocation the connection remains *unspecified*.

- 2. Choose the connection partner and the type of connection and confirm with [OK].
 - ⇒ If activated, a properties dialog for the according connection opens as link to your PLC user program.

Insert new connection
Connection partner
In Project
SIMATIC 300
Project: Connections Sation: SIMATIC 300 Module: CPU
Connection
Type: S7 connection
OK Apply Cancel

3. After every connection was configured by this way, you may save and compile your project and exit NetPro.

Connection types	With this CPU exclusively Siemens S7 connection may be configured with Siemens NetPro.
Siemens S7 connection	For data transfer with Siemens S7 connections the FB/SFB VIPA handling blocks are necessary; the deployment is described in the manual "Operation list" of your CPU.
	At Siemens S7 connections the communication connections are specified by a con- nection ID for each communication partner.
	A connection is specified by the local and partner connection end point.
	At Siemens S7 connections the TSAPs must be congruent crosswise. The following parameters define a connection end point:

Configure Siemens S7 connections

The following parameters define a connection end point:

Station A				Station B
remote TSAP	\rightarrow	Siemens	\rightarrow	local TSAP
local TSAP	÷	S7 connection	÷	remote TSAP
ID A				ID B

Combination options with deployment of the FB/SFB VIPA handling blocks

Connection partner	Connection establishing	Connection	
specified in NetPro	active/passive	specified	
(in the current project)			
unspecified in NetPro	active	specified	
(in the current project)	passive	unspecified	
unspecified in NetPro	active/passive	specified (connection name in an other	
(in the unknown project)		project)	

In the following every relevant parameter of a Siemens S7 connection is described:

- Local connection end point: Here you may define how the connection is to be established. Since the Siemens SIMATIC Manager can identify the communication options by means of the end points, some options are already preset and may not be changed.
 - Establish an active connection:
 An established connection is precondition for data transfer. By activating the option Establish an active connection the local station establishes the connection. Please regard not every station is able to establish a connection. Here the job is to be made by the partner station.
 - One-way:

If activated only one-way communication blocks like PUT and GET may be used for communication in the user program. Here the partner station acts as server, which neither may send active nor receive active

- Block parameters
 - Local ID:

The ID is the link to your PLC program. The ID must be identical to the ID of the call interface of the FB/SFB VIPA handling block.

– [Default]:

As soon as you click at [Default], the ID is reset to system generated ID.

Connection path:

In this part of the dialog window the connection path between the local and the partner station may be set. Depending on the linking of the modules the possible interfaces for communication are listed in a selection field.

[Address details]:

With this button a dialog window is opened, which shows address information about the local and partner station. The parameters may also be changed.

– TSAP:

With Siemens S7 connections a TSAP is automatically generated of the connection resource (one-way/two-way) and state of place (rack/slot respectively system internal ID at PC stations).

Connection resource:

The connection resource is part of the TSAP of the local station respectively of the partner. Not every connection resource may be used for every connection type. Depending on the connection partner and the connection type the range of values is limited respectively the connection resource is fix specified.

Siemens S7 connection - Communication functions

n - With the SPEED7 CPUs of VIPA there are two possibilities for the deployment of the communication functions:

- Siemens S7-300 communication functions: By integration of the function blocks FB 12 ... FB 15 from VIPA you may access the Siemens S7-300 communication functions.
- Siemens S7-400 communication functions: For the Siemens S7-400 communication functions the SFB 12 ... SFB 15 are to be used, which were integrated to the operating system of the CPU. Here copy the interface description of the SFBs from the standard library at system function block to the directory container, generate an instance data block for each call and call the SFB with the associated instance data block.

Configure Open Communication

Function blocks

FB/SFB	Label	Description	
FB/SFB 12	BSEND	Sending data in blocks:	
		FB/SFB 12 BSEND sends data to a remote partner FB/SFB of the type BRCV (FB/SFB 13). The data area to be transmitted is segmented. Each segment is sent individually to the partner. The last segment is acknowledged by the partner as it is received, independently of the calling up of the corresponding FB/SFB/FB BRCV. With this type of data transfer, more data can be transported between the communications partners than is possible with all other communication FBs/SFBs for configured S7 connections, namely 65534bytes.	
FB/SFB 13 BRCV		Receiving data in blocks:	
		The FB/SFB 13 BRCV can receive data from a remote partner FB/SFB of the type BSEND (FB/SFB 12). The parameter R_ID of both FB/SFBs must be identical. After each received data segment an acknowledgement is sent to the partner FB/SFB and the LEN parameter is updated.	
FB/SFB 14	GET	Remote CPU read:	
		The FB/SFB 14 GET can be used to read data from a remote CPU. The respective CPU must be in RUN mode or in STOP mode.	
FB/SFB 15	PUT	Remote CPU write:	
		The FB/SFB 15 PUT can be used to write data to a remote CPU. The respective CPU may be in RUN mode or in STOP mode.	

7.9 Configure Open Communication

Handling blocks

Those in the following listed UTDs and FBs serve for "open communication" with other Ethernet capable communication partners via your user program. These blocks are part of the Siemens SIMATIC Manager. You will find these in the "Standard Library" at "Communication Blocks". Please consider when using the blocks for open communication that the partner station does not have to be configured with these blocks. This can be configured with AG_SEND/AG_RECEIVE or IP_CONFIG. First you have to establish a hardware configuration of the CPU and Ethernet PG/OP channel before you can use the handling blocks.

Hardware configuration:

- CPU
 - Schapter 4.4 'Hardware configuration CPU' on page 65
- Ethernet PG/OP channel & Chapter 4.6 'Hardware configuration - Ethernet PG/OP channel' on page 68

To specify the Ethernet PG/OP channel, the following values are defined in the UDT 65:

- local_device_id
 - 00h: Ethernet PG/OP channel of the CPU
- next_staddr_len
 - 01h: Ethernet PG/OP channel of the CPU
- next_staddr
 - 04h: Ethernet PG/OP channel of the CPU

UDTs

FB	Designation	Connection-oriented protocols: TCP native as per RFC 793, ISO on TCP as per RFC 1006	Connectionless protocol: UDP according to RFC 768
UDT 65*	TCON_PAR	Data structure for assigning connec- tion parameters	Data structure for assigning parameters for the local communications access point
UDT 66*	TCON_ADR		Data structure for assigning addressing parameters for the remote partner

*) More information about the usage of these blocks may also be found in the manual "SPEED7 Operation List" from VIPA.

FBs

FB	Designation	Connection-oriented protocols: TCP native as per RFC 793, ISO on TCP as per RFC 1006	Connectionless protocol: UDP according to RFC 768
FB 63*	TSEND	Sending data	
FB 64*	TRCV	Receiving data	
FB 65*	TCON	Establishing a connection	Configuring the local communications access point
FB 66*	TDISCON	Terminating a connection	Closing the local communications access point
FB 67*	TUSEND		Sending data
FB 68*	TURCV		Receiving data

*) More information about the usage of these blocks may also be found in the manual "SPEED7 Operation List" from VIPA.

Connection-oriented protocols

- Connection-oriented protocols establish a (logical) connection to the communication partner before data transmission is started.
- And if necessary they terminate the connection after the data transfer was finished.
- Connection-oriented protocols are used for data transmission when reliable, guaranteed delivery is of particular importance.
- In general, many logical connections can exist on one physical line.

Configure Open Communication

The following connection-oriented protocols are supported with FBs for open communication via Industrial Ethernet:

- TCP/IP native according to RFC 793 (connection types 01h and 11h):
 - During data transmission, no information about the length or about the start and end of a message is transmitted.
 - The receiver has no means of detecting where one message ends in the data stream and the next one begins.
 - The transfer is stream-oriented. For this reason, it is recommended that the data length of the FBs is identical for the sending and receiving station.
 - If the number of received data does not fit to the preset length you either will get not the whole data, or you will get data of the following job. The receive block copies as many bytes into the receive area as you have specified as length. After this, it will set NDR to TRUE and write RCVD_LEN with the value of LEN. With each additional call, you will thus receive another block of sent data.
- ISO on TCP according to RFC 1006:
 - During data transmission, information on the length and the end of the message is also transmitted.
 - The transfer is block-oriented
 - If you have specified the length of the data to be received greater than the length of the data to be sent, the receive block will copy the received data completely into the receive range. After this, it will set NDR to TRUE and write RCVD_LEN with the length of the sent data.
 - If you have specified the length of the data to be received less than the length of the sent data, the receive block will not copy any data into the receive range but instead will supply the following error information: ERROR = 1, STATUS = 8088h.

Connection-less protocol

There is thus no establishment and termination of a connection with a remote partner.
 Connection-less protocols transmit data with no acknowledge and with no reliable guaranteed delivery to the remote partner.

The following connection-oriented protocol is supported with FBs for open communication via Industrial Ethernet:

- UDP according to RFC 768 (with connection type 13h):
 - In this case, when calling the sending block you have to specify the address parameters of the receiver (IP address and port number).
 - During data transmission, information on the length and the end of the message is also transmitted.
 - In order to be able to use the sending and receiving blocks first you have to configure the local communications access point at both sides.
 - With each new call of the sending block, you re-reference the remote partner by specifying its IP address and its port number.
 - If you have specified the length of the data to be received greater than the length of the data to be sent, the receive block will copy the received data completely into the receive range. After this, it will set NDR to TRUE and write RCVD_LEN with the length of the sent data.
 - If you have specified the length of the data to be received less than the length of the sent data, the receive block will not copy any data into the receive range but instead will supply the following error information: ERROR = 1, STATUS = 8088h.

Overview

8 Option: Deployment PROFIBUS communication

8.1 Overview

	To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a VSC storage media from VIPA. By plugging the VSC storage card and then an overall reset the according functionality is activated. Chapter 4.15 'Deploy- ment storage media - VSD, VSC' on page 88
PROFIBUS DP	PROFIBUS is an international standard applicable to an open and serial field bus for
	building, manufacturing and process automation that can be used to create a low (sensor-/actuator level) or medium (process level) performance network of program- mable logic controllers.
	 PROFIBUS comprises an assortment of compatible versions. The following details refer to PROFIBUS DP.
	PROFIBUS DP is a special protocol intended mainly for automation tasks in a manufacturing environment. DP is very fast, offers Plug'n'Play facilities and provides a cost effective alternative to parallel cabling between PLC and remote I/O. PROFIBUS DP used data are the sense of the sense
	 was designed for high-speed data communication on the sensor-actuator level. The data transfer referred to as "Data Exchange" is cyclical. During one bus cycle, the master reads input values from the slaves and writes output information to the slaves.
CPU with DP master	The PROFIBUS DP master is to be configured in the hardware configurator from Sie- mens. Here the configuration happens by the sub module X1 (MPI/DP) of the Siemens CPU. After the transmission of the data to the CPU, the configuration data are internally passed on to the PROFIBUS master part. During the start-up the DP master automati- cally includes his data areas into the address range of the CPU. Project engineering in the CPU is not required.
Deployment of the DP master with CPU	Via the PROFIBUS DP master PROFIBUS DP slaves may be coupled to the CPU. The DP master communicates with the DP slaves and links up its data areas with the address area of the CPU. At every POWER ON respectively overall reset the CPU fetches the I/O mapping data from the master. At DP slave failure, the OB 86 is requested. If this is not available, the CPU switches to STOP and BASP is set. As soon as the BASP signal comes from the CPU, the DP master is setting the outputs of the connected periphery to zero. The DP master remains in the operating mode RUN independent from the CPU.
DP slave operation	For the deployment in a super-ordinated master system you first have to project your slave system as Siemens CPU in slave operation mode with configured in-/output areas. Afterwards you configure your master system. Couple your slave system to your master system by dragging the CPU 31x from the hardware catalog at <i>Configured stations</i> onto the master system, choose your slave system and connect it.
Operating mode DP slave: Test, commissioning, routing (active/passive)	There is the possibility to enable the option <i>'Test, commissioning, routing'</i> in the hard- ware configuration by means of the properties dialog of the PROFIBUS via the register <i>'Operating mode'</i> at <i>'DP slave'</i> . The activation affects as follows:
	The PROFIBUS interface gets an "active" PROFIBUS node, this means it is involved in the token rotation.
	Via this interface you have PG/OP functions (programming, status request, control, test).
	 The PROFIBUS interface serves as a gateway (S7 routing). The bus rotation time can exceed.

Hardware configuration - CPU

When disabled, the PROFIBUS interface operates as passive DP slave with the following characteristics:

- The PROFIBUS interface gets an "passive" PROFIBUS node, this means it is not involved in the token rotation.
- Bus rotation time is not influenced.
- S7 routing is not possible.

8.2 Fast introduction

Overview

The PROFIBUS DP slave is to be configured in the hardware configurator from Siemens. Here the configuration happens by the sub module X1 (MPI/DP) of the Siemens CPU.

To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a VSC storage media from VIPA. By plugging the VSC storage card and then an overall reset the according functionality is activated. ♦ Chapter 4.15 'Deployment storage media - VSD, VSC' on page 88

Steps of configuration For the configuration of the PROFIBUS DP master please follow the following approach:

- Enable bus functionality via VSC
- Hardware configuration CPU
- Deployment as DP master or DP slave
 - With activating the bus function 'PROFIBUS DP master' by means of the VSC, the bus function 'PROFIBUS DP slave' is also unlocked.
- Transfer of the complete project to CPU

With the Siemens SIMATIC Manager, the CPU 013-CCF0R00 from VIPA is to be configured as

CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)

The integrated PROFIBUS DP master (X3) is to be configured and connected via the sub module X1 (MPI/DP).

8.3 Hardware configuration - CPU

Precondition

The configuration of the CPU takes place at the Siemens *'hardware configurator'*. The hardware configurator is part of the Siemens SIMATIC Manager. It serves for project engineering. Please use for configuration the Siemens SIMATIC Manager V 5.5 SP2 and up. The modules, which may be configured here are listed in the hardware catalog. If necessary you have to update the hardware catalog with *'Options* \rightarrow *Update Catalog'*.

For project engineering a thorough knowledge of the Siemens SIMATIC Manager and the Siemens hardware configurator is required!

Proceeding

With the Siemens SIMATIC Manager the following steps should be executed:

- **1.** Start the Siemens hardware configurator with a new project.
- **2.** Insert a profile rail from the hardware catalog.
- 3. Place at 'Slot'-Number 2 the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).

Slot	Module
1	
2	CPU 31
X1	MPI/DP
X2	PN-IO
Х2	Port 1
Х2	Port 2
3	

The integrated PROFIBUS DP master (X3) is to be configured and connected via the sub module X1 (MPI/DP).

Deployment as PROFIBUS DP master

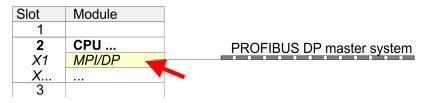

8.4 Deployment as PROFIBUS DP master

Precondition

The hardware configuration described before was established.

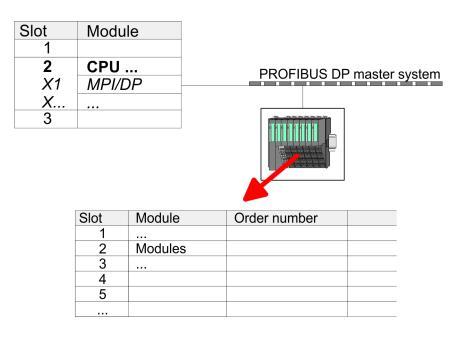

Proceeding

- **1.** Open the properties dialog of the DP interface of the CPU by means of a doubleclick at *'MPI/DP'*.
- 2. Set at Interface: Type "PROFIBUS".
- **3.** Connect to PROFIBUS and preset an address (preferably 2). Confirm your input with [OK].
- 4. Switch at Operating mode to "DP master" and confirm the dialog with [OK].
 - ⇒ A PROFIBUS DP master system is inserted:

Now the project engineering of your PROFIBUS DP master is finished. Please link up now your DP slaves with periphery to your DP master.

- **1.** For the project engineering of PROFIBUS DP slaves you search the concerning PROFIBUS DP slave in the hardware catalog and drag&drop it in the subnet of your master.
- **2.** Assign a valid PROFIBUS address to the DP slave.
- **3.** Link up the modules of your DP slave system in the plugged sequence and add the addresses that should be used by the modules.
- **4.** If needed, parametrize the modules.
- **5.** Save, compile and transfer your project.

Fast introduction

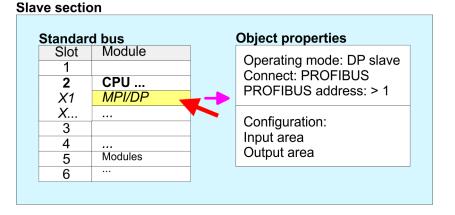

8.5 Deployment as PROFIBUS DP slave

In the following the deployment of the PROFIBUS section as "intelligent" DP slave on master system is described, which exclusively may be configured in the Siemens SIMATIC Manager. The following steps are required:

- **1.** Configure a station with a CPU with operating mode DP slave.
- **2.** Connect to PROFIBUS and configure the in-/output area for the slave section.
- **3.** Save and compile your project.
- **4.** Configure another station with another CPU with operating mode DP master.
- 5. Connect to PROFIBUS and configure the in-/output ranges for the master section.
- 6. Save, compile and transfer your project to your CPU.

Project engineering of the slave section

- **1.** Start the Siemens SIMATIC Manager and configure a CPU as described at "Hard-ware configuration CPU".
 - **2.** Designate the station as "...DP slave".
 - 3. Add your modules according to the real hardware assembly.
 - **4.** Open the properties dialog of the DP interface of the CPU by means of a doubleclick at *'MPI/DP'*.
 - 5. Set Interface type to "PROFIBUS".
 - 6. Connect to PROFIBUS and preset an address (e.g. 3) and confirm with [OK].
 - 7. Switch at Operating mode to "DP slave" .
 - **8.** Via Configuration you define the in-/output address area of the slave CPU, which are to be assigned to the DP slave.
 - **9.** Save, compile and transfer your project to your CPU.

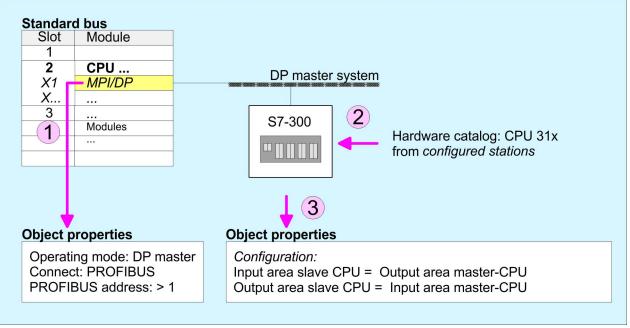

Project engineering of the master section

- **1.** Insert another station and configure a CPU.
- **2.** Designate the station as "...DP master".
- 3. Add your modules according to the real hardware assembly.
- **4.** Open the properties dialog of the DP interface of the CPU by means of a doubleclick at *'MPI/DP'*.
- **5.** Set Interface: type to "PROFIBUS".
- **6.** Connect to PROFIBUS and preset an address (e.g. 2) and confirm with [OK].
- 7. Switch at Operating mode to "DP master" and confirm the dialog with [OK].

Deployment as PROFIBUS DP slave

- 8. Connect your slave system to this master system by dragging the "CPU 31x" from the hardware catalog at *Configured stations* onto the master system and select your slave system to be coupled.
- 9. Solution Open the Configuration at Object properties of your slave system.
- **10.** Via double click to the according configuration line you assign the according input address area on the master CPU to the slave output data and the output address area to the slave input data.
- **11.** Save, compile and transfer your project to your CPU.

Master section

8.6 **PROFIBUS** installation guidelines

PROFIBUS in general

A PROFIBUS DP network may only be built up in linear structure.

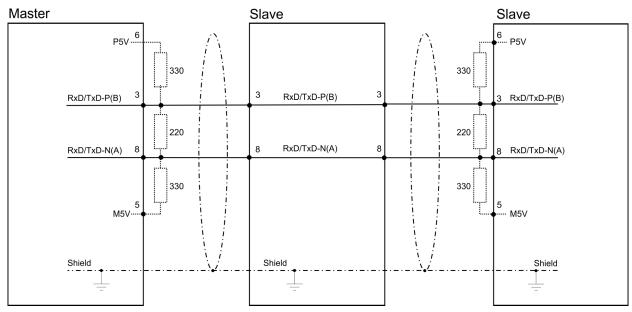

- PROFIBUS DP consists of minimum one segment with at least one master and one slave.
- A master has always been deployed together with a CPU.
- PROFIBUS supports max. 126 participants.
- Per segment a max. of 32 participants is permitted.
- The max. segment length depends on the transfer rate: 9.6 ... 187.5bit/s → 1000m 500kbit/s → 400m 1.5Mbit/s → 200m
 - 3 ... 12Mbit/s \rightarrow 100m
- Max. 10 segments may be built up. The segments are connected via repeaters. Every repeater counts for one participant.
- The bus respectively a segment is to be terminated at both ends.
- All participants are communicating with the same transfer rate. The slaves adjust themselves automatically on the transfer rate.

Transfer medium

- As transfer medium PROFIBUS uses an isolated twisted-pair cable based upon the RS485 interface.
- The RS485 interface is working with voltage differences. Though it is less irritable from influences than a voltage or a current interface. You are able to configure the network as well linear as in a tree structure.
- Max. 32 participants per segment are permitted. Within a segment the members are linear connected. The segments are connected via repeaters. The maximum segment length depends on the transfer rate.
- PROFIBUS DP uses a transfer rate between 9.6kbit/s and 12Mbit/s, the slaves are following automatically. All participants are communicating with the same transfer rate.
- The bus structure under RS485 allows an easy connection res. disconnection of stations as well as starting the system step by step. Later expansions don't have any influence on stations that are already integrated. The system realizes automatically if one partner had a fail down or is new in the network.

Bus connection

The following picture illustrates the terminating resistors of the respective start and end station.

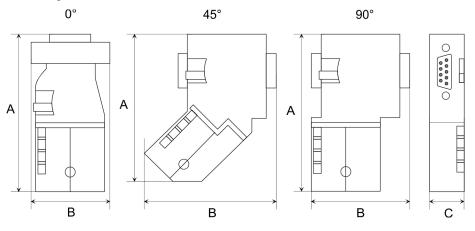

PROFIBUS installation guidelines

The PROFIBUS line has to be terminated with its ripple resistor. Please make sure to terminate the last participants on the bus at both ends by activating the terminating resistor.

EasyConn bus connector

In PROFIBUS all participants are wired parallel. For that purpose, the bus cable must be feed-through. Via the order number 972-0DP10 you may order the bus connector "Easy-Conn" from VIPA. This is a bus connector with switchable terminating resistor and integrated bus diagnostic.

Dimensions in mm	0°	45°	90°
А	64	61	66
В	34	53	40
C	15.8	15.8	15.8

To connect this EasyConn plug, please use the standard PROFIBUS cable type A (EN50170). Starting with release 5 you also can use highly flexible bus cable:

Lapp Kabel order no: 2170222, 2170822, 2170322.

With the order no. 905-6AA00 VIPA offers the "EasyStrip" de-isolating tool that makes the connection of the EasyConn much easier.

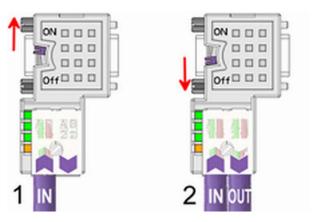

Dimensions in mm

Termination with "Easy-Conn"

The "EasyConn" bus connector is provided with a switch that is used to activate a terminating resistor.

Commissioning and Start-up behavior

Wiring

[1] 1./last bus participant

[2] further participants

CAUTION!

The terminating resistor is only effective, if the connector is installed at a bus participant and the bus participant is connected to a power supply.

The tightening torque of the screws to fix the connector to a device must not exceed 0.02Nm!

A complete description of installation and deployment of the terminating resistors is delivered with the connector.

Assembly

- 1. Loosen the screw.
- 2. Lift contact-cover.
- 3. Insert both wires into the ducts provided (watch for the correct line colour as below!)
- 4. Please take care not to cause a short circuit between screen and data lines!

- **5.** Close the contact cover.
- 6. Tighten screw (max. tightening torque 0.08Nm).

The green line must be connected to A, the red line to B!

8.7 Commissioning and Start-up behavior

Start-up on delivery

In delivery the CPU is overall reset. The PROFIBUS part is deactivated and its LEDs are off after Power ON.

Commissioning and Start-up behavior

Online with bus parameter without slave project	The DP master can be served with bus parameters by means of a hardware configura- tion. As soon as these are transferred the DP master goes online with his bus parameter. This is shown by the RUN LED. Now the DP master can be contacted via PROFIBUS by means of his PROFIBUS address. In this state the CPU can be accessed via PROFIBUS to get configuration and DP slave project.
Slave configuration	If the master has received valid configuration data, he switches to <i>Data Exchange</i> with the DP Slaves. This is indicated by the DE-LED.
CPU state controls DP master	After PowerON respectively a receipt of a new hardware configuration the configuration data and bus parameter were transferred to the DP master. Dependent on the CPU state the following behavior is shown by the DP master:
Master behavior at CPU STOP	 The global control command "Clear" is sent by the master. Then the DP slaves disable the outputs. DP slaves with fail safe mode were provided with output telegram length "0". DP slaves without fail safe mode were provided with the whole output telegram but with output data = 0. The input data of the DP slaves were further cyclically transferred to the input area of the CPU.
Master behavior at CPU RUN	 The global control command "Operate" is sent by the master. Then the DP slaves enable the outputs. Every connected DP slave is cyclically attended with an output telegram containing recent output data. The input data of the DP slaves were cyclically transferred to the input area of the CPU.

9 Configuration with VIPA SPEED7 Studio

9.1 SPEED7 Studio - Overview

SPEED7 Studio - Working environment In this part the project engineering of the VIPA CPU in the VIPA SPEED7 Studio is shown. Here only the basic usage of the SPEED7 Studio together with a VIPA CPU is shown. Please note that software changes can not always be considered and it may thus be deviations to the description. In the SPEED7 Studio your VIPA PLCs may be configured and linked. For diagnostics online tools are available.

More information can be found in the online help respectively in documentation of the SPEED7 Studio.

Starting the SPEED7 Studio

- Click at the button. You can find SPEED7 Studio in Windows Start at 'VIPA'.
 - ⇒ SPEED7 Studio is started. The start page is opened.

SPEED7 Studio

		ecently used Pro	1	
New project		Project Folder	Source	Last Access 10/29/2013 5:59:03 PM
And the bridges	Pu	MyProject	local	10/29/2015 5:59:05 PM
🔊 Open project				
9				
Import project				
Delete project				
roject:				

- (1) Start (2) Project
- You can create a new project, open a saved project, or delete projects. If a project is open, you can open the *'Project overview'* or add a new device.
- (3) Last projects Here recently opened projects are listed.

You can repeatedly run SPEED7 Studio in order to work with different projects. You can not open the same project in the various instances of SPEED7 Studio.

SPEED7 Studio - Work environment

End SPEED7 Studio

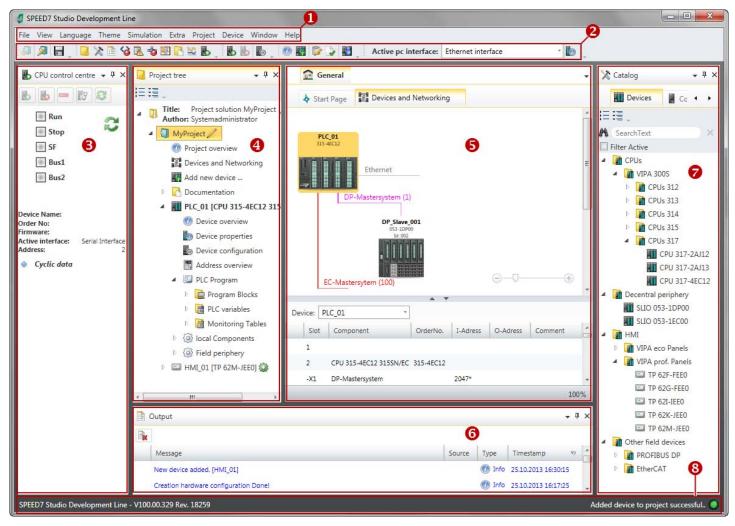

Select one of the following options if you want to end the program:

- Main window: Click on the Close button of the SPEED7 Studio program window.
- Menu bar Select 'File → Exit'.
- Keyboard: Press [Alt] + [F4].

After you have made changes to the project, a dialogue window opens where you can select whether to save or ignore the changes.

⇒ SPEED7 Studio is ended.

9.2 SPEED7 Studio - Work environment

- (1) Menu bar
- (2) Toolbar
- (3) CPU control centre
- (4) Project tree

- (5) Area of operations
- (6) Output range
- (7) Catalog/properties
- (8) Status line

You can show and hide additional windows and the arrangement and size of the windows can be adjusted.

VIPA System SLIO	Configuration with VIPA SPEED7 Studio
	SPEED7 Studio - Work environment
(1) Menu bar	Most of the commands you need for working with <i>SPEED7 Studio</i> are provided in the menu bar. Further commands can be accessed via the context menus using the right mouse button, e.g. functions of a device in the project tree.
	The menu commands ' <i>Project</i> ' and ' <i>Device</i> ' are only shown if a project is open. The menu commands ' <i>Image</i> ' is only shown if a HMI image is open.
	You can use the menus with the mouse or the keyboard.
(2) Toolbar	Important commands you need for working with SPEED7 Studio are provided in the toolbar. More commands can be accessed via the toolbars and push buttons of different editors.
	Some of the commands in the toolbar are only shown if a project is open.
(3) CPU control centre	In the CPU control centre, you can view the current mode and other control data and con- trol the CPU.
(4) Project tree	Any project device and project data can be accessed via the project tree. The project tree includes any object which you have created in the project, e.g. devices, components, pro- gram blocks, HMI images. Here you can add or remove devices and components. Fur- thermore, you can open editors in order to edit settings, configurations, the control pro- gram and visualisation.
(5) Area of operations	Devices and project data can be edited in the area of operations. You can open different editors for this purpose. The register in the area of operations is divided into two register levels. You can switch through the editors in the area of operations via the tabs.
(6) Output range	Information on executed activities and background operations are displayed on the output range.
(7) Catalog/properties	Devices and components which you want to add to the project can be selected in the cat- alog. You can also select objects which you want to add to the PLC program or to HMI images.
(8) Status line	The version of <i>SPEED7 Studio</i> is displayed at the left edge of the status line. The pro- gress bar for background operations and status messages is shown at the right edge. As long as there are no background operations, the status message created at last is shown.

SPEED7 Studio - Work environment > Project tree

Devices and components which you want to add to the project can be selected in the catalog. You can also select objects which you want to add to the PLC program or to HMI images.

Show catalog:

If the catalog is not displayed, you must select either 'View \rightarrow Catalog' or press [Strg]+ [Shift]+[C].

- (1) Switch to another view If the properties are displayed instead of the catalog, you must click on 'Catalog' at the lower screen edge.
- (2) Register Certain tabs are displayed in the catalog, depending on which editor window is opened in the foreground.

(3) Show/hide objects The o

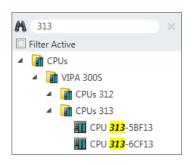

The objects in the catalog are arranged in a tree structure. You can show or hide objects: Hide all objects ('Project \rightarrow Reduce project tree')

- Hide all objects ('Project → Reduce catalog tree')
- Show all objects ('Project → Expand catalog tree')
- Hide slave objects / close folder
- Show slave objects / open folder

Configuration with VIPA SPEED7 Studio

SPEED7 Studio - Work environment > Catalog

(4) Search

You can search for certain objects in the catalog.

- **1.** Enter a search text in the input field.
 - ⇒ Only those objects are displayed in the catalog which contain the search text.
- **2.** \blacktriangleright Click on \boxtimes to delete the search text.

 \Rightarrow The object is added.

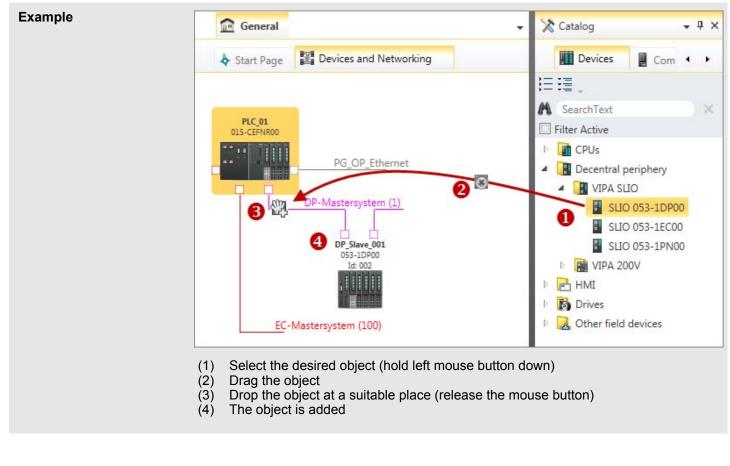

⇒ All objects are displayed in the catalog.

(5) Filter

With 'enabled' Filter, only these modules are shown in the Catalog which are relevant for configuration

(6) Add object

Drag the desired object from the catalog to a suitable position.

(7) Catalog information

The catalog information shows detailed information of the selected object, e.g. name, producer, version and order information. SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

9.3 SPEED7 Studio - Hardware configuration - CPU

Precondition

For project engineering a thorough knowledge of the SPEED7 Studio is required!

Proceeding

- **1.** Start the SPEED7 Studio.
- **2.** Create a new project in the Work area with 'New project'.
 - ⇒ A new project is created and the view *'Devices and networking'* is shown.
- 3. Click in the Project tree at 'Add new device ...'.
 - \Rightarrow A dialog for device selection opens.
- 4. Select from the 'Device templates' your CPU and click at [OK].
 - ⇒ The CPU is inserted in 'Devices and networking' and the 'Device configuration' is opened.

Device configuration

Slot	Module	 	
0	CPU 013-CCF0R00		
-X1	PG_OP_Ethernet		
-X3	MPI interface		

9.4 SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

Overview

The CPU has an integrated Ethernet PG/OP channel. This channel allows you to program and remote control your CPU.

- The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2.
- The Ethernet PG/OP channel also gives you access to the internal web page that contains information about firmware version, connected I/O devices, current cycle times etc.
- At the first commissioning respectively after a factory reset the Ethernet PG/OP channel has no IP address.

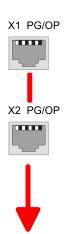

SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

- For online access to the CPU via the Ethernet PG/OP channel, valid IP address parameters have to be assigned to this. This is called "initialization".
- This can be done with the SPEED7 Studio.

Assembly and commissioning

- 1. Install your System SLIO with your CPU.
 - **2.** Wire the system by connecting cables for voltage supply and signals.
 - **3.** Connect the one of the Ethernet jacks (X1, X2) of the Ethernet PG/OP channel to Ethernet.
 - **4.** Switch on the power supply.
 - ⇒ After a short boot time the CP is ready for communication. He possibly has no IP address data and requires an initialization.

"Initialization"

You get valid IP address parameters from your system administrator. The assignment of the IP address data happens online in the *SPEED7 Studio* with the following proceeding:

1. Ethernet PG/OP

Determine the current Ethernet (MAC) address of your Ethernet PG/OP channel. This can be found at the front of the CPU labelled as "MAC PG/OP: ...".

2. Start the SPEED7 Studio with your project.

MAC PG/OP: 00-20-D5-77-05-10

- 3. Click in the Project tree at 'Devices and networking'.
 - ⇒ You will get a graphical object view of your CPU.

4. Click at the network '*PG_OP_Ethernet*'.

SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

- 5. ▶ Select 'Context menu → Determine accessible partner'.
 - ⇒ A dialog window opens.

4	
Active gateway	Ethernet interface
Network interface card: Net	A Search

- **6.** Select the according network interface card, which is connected to the Ethernet PG/OP channel and click at 'Search' to determine the via MAC address reachable device.
 - \Rightarrow The network search is started and the found stations are listed in a table.

7.		Devices	IP	MAC	Device	
	1		172.20	00:20:	VIPA	
	2					

Click in the list at the module with the known MAC address. This can be found at the front of the CPU labelled as "MAC PG/OP: ...".

- **8.** Click at 'Set IP address'. Now set the IP configuration by entering 'IP address', 'Subnet mask' and 'Gateway'.
- 9. Click at 'Set IP address'.
 - ⇒ The IP address is transferred to the module and the list is refreshed. Directly after the assignment the Ethernet PG/OP channel is online reachable using the set IP address data. The value remains as long as it is reassigned, it is overwritten by a hardware configuration or a factory reset is executed.
- **10.** With clicking at 'Apply settings' the IP address data a stored in the project.

parame- If you are not online, you can assign IP address data to your Ethernet PG/OP channel with following proceeding:

- 1. Start the SPEED7 Studio with your project.
- **2.** Click in the *Project tree* at *'Devices and networking'*.
 - ⇒ You will get a graphical object view of your CPU.

- 3. Click at the network 'PG_OP_Ethernet'.
- **4.** ▶ Select 'Context menu → Interface properties'.
 - A dialog window opens. Here you can enter the IP address data for your Ethernet PG/OP channel.

Take IP address parameters in project SPEED7 Studio - Hardware configuration - I/O modules

- **5.** Confirm with [OK].
 - ⇒ The IP address data are stored in your project listed in *'Devices and networking'* at *'Local components'*.

After transferring your project your CPU can be accessed via Ethernet PG/OP channel with the set IP address data.

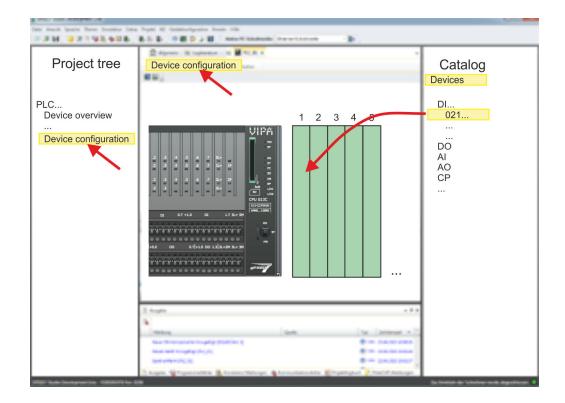

Local components

Slot	Module	 	IP address	
0	CPU 013-CCF0R00			
-X1	PG_OP_Ethernet		172.20.120.40	
-X3	MPI interface			

9.5 SPEED7 Studio - Hardware configuration - I/O modules

Hardware-Konfiguration der Module

- **1.** Klicken Sie im 'Projektbaum' auf 'PLC... > Gerätekonfiguration'.
- **2.** Binden Sie in der '*Gerätekonfiguration*' ab Steckplatz 1 Ihre System SLIO Module in der gesteckten Reihenfolge ein. Gehen Sie hierzu in den Hardware-Katalog und ziehen Sie das entsprechende Modul auf die entsprechende Position in der *Gerätekonfiguration.*

Parametrierung

Zur Parametrierung doppelklicken Sie in der *'Gerätekonfiguration'* auf das zu parametrierende Modul. Daraufhin werden die Parameter des Moduls in einem Dialogfenster aufgeführt. Hier können Sie Ihre Parametereinstellungen vornehmen. *Parametrierung zur Laufzeit* Unter Einsatz der SFCs 55, 56 und 57 können Sie zur Laufzeit Parameter ändern und an die entsprechenden Module übertragen. Hierbei sind die modulspezifischen Parameter in sogenannten "Datensätzen" abzulegen. Näheres zum Aufbau der Datensätze finden Sie in der Beschreibung zu den Modulen.

9.6 Deployment I/O periphery

9.6.1 Overview

Project engineering and parametrization

- On this CPU the connectors for digital respectively analog signal and *Technological functions* are combined in a one casing.
- Die Project engineering happens in the VIPA SPEED7 Studio as CPU 013-CCF0R00.
- For parametrization of the digital I/O periphery and the *technological functions* the corresponding sub modules of the CPU013-CCF0R00 are to be used.
- The controlling of the operating modes of the *technological functions* happens by means of handling blocks of the user program.

9.6.2 Analog input

- 9.6.2.1 Overview
- 2xUx12Bit (0 ... 10V)
- Sub module 'A/2'
- Chapter 5.3 'Analog input' on page 97

9.6.2.2 Parametrization in SPEED7 Studio

9.6.2.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
AI2	800	WORD	Analog input channel 0 (X4)
	802	WORD	Analog input channel 1 (X4)

9.6.2.2.2 'Parameter'

'Filtering channel 0/1'

The analog input part has a filter integrated. The parametrization of the filter happens via the parameter *'Filter channel 0/1'*. The default value of the filter is 1000ms. The following values can be entered:

- 2ms: no filter
- 100ms: small filter
- 1000ms: medium filter
- 10000ms: maximum filter

9.6.3 Digital input

9.6.3.1 Overview

- 16xDC 24V
- Sub module 'DI16/DO12'
- Chapter 5.4 'Digital input' on page 100

Deployment I/O periphery > Counter

9.6.3.2 Parametrization in SPEED7 Studio

9.6.3.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
DI16/DO12	136	BYTE	Digital input I+0.0 I+0.7 (X4)
	137	BYTE	Digital input I+1.0 I+1.7 (X4)

9.6.3.2.2 'Inputs'

'Trigger for process interrupt'	Here you can specify a hardware interrupt for each input for the corresponding edge. The hardware interrupt is disabled, if nothing is selected (default setting). A diagnostics interrupt is only supported with <i>Hardware interrupt lost</i> .
	Here is valid:
	 Rising edge: Edge 0-1 Falling edge: Edge 1-0
Input delay	 The input delay can be configured per channel in groups of 4. An input delay of 0.1ms is only possible with "fast" inputs, which have a max. input frequency of 100kHz & 'X4: Connector' on page 43. Within a group, the input delay for slow inputs is limited to 0.5ms. Range of values: 0.1ms / 0.5ms / 3ms / 15ms

9.6.4 Digital output

9.6.4.1 Overview

- 12xDC 24V, 0.5A
- Sub module *'DI16/DO12'*
- Schapter 5.5 'Digital output' on page 103

9.6.4.2 Parametrization in SPEED7 Studio

9.6.4.2.1 'I/O addresses'

Sub module	Output address	Access	Assignment
DI16/DO12	136	BYTE	Digital output Q+0.0 Q+0.7 (X5)
	137	BYTE	Digital output Q+1.0 Q+1.3 (X5)

9.6.5 Counter

9.6.5.1 Overview

- 4 channels
- Sub module: 'Counter'
- ♦ Chapter 5.6 'Counting' on page 105

9.6.5.2 Parametrization in SPEED7 Studio

9.6.5.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
Count	816	DINT	Channel 0: Counter value / Frequency value
	820	DINT	Channel 1: Counter value / Frequency value
	824	DINT	Channel 2: Counter value / Frequency value
	828	DINT	Channel 3: Counter value / Frequency value

9.6.5.2.2 Basic parameters

Select interrupt

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is disabled.
- Process: The following events of the counter can trigger a hardware interrupt (selectable via 'Count'):
 - Hardware gate opening
 - Hardware gate closing
 - On reaching the comparator
 - on Counting pulse
 - on overflow
 - on underflow
- Diagnostics+process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

9.6.5.2.3 *'Channel x'*

Operating mode

Select via 'Channel' the channel select via 'Operating' the counter operating mode. The following counter operating modes are supported:

- Not parametrized: Channel is de-activated
- Count endless
- Count once
- Count periodical

Counter

Operating mode

Default values and structure of this dialog box depend on the selected 'Operating mode'.

Deployment I/O periphery > Counter

Parameter overview

Operating parameters	Description	Assignment
Main count direction	 None No restriction of the counting range Up: Restricts the up-counting range. The counter starts from 0 or <i>load value</i>, counts in positive direction up to the declaration <i>end value</i> -1 and then jumps back to <i>load value</i> at the next positive transducer pulse. Down: Restricts the down-counting range. The counter starts from the declared <i>start value</i> or <i>load value</i> in negative direction, counts to 1 and then jumps to <i>start value</i> at the next negative encoder pulse. Function is disable with <i>count continuously</i>. 	None
Gate function	 <i>Cancel count:</i> The count starts when the gate opens and resumes at the <i>load value</i> when the gate opens again. <i>Stop count:</i> The count is interrupted when the gate closes and resumed at the last actual counter value when the gate opens again. <i>Chapter 5.6.6.2 'Gate function' on page 119</i> 	Abort count process
Start value	Start value with counting direction backward.	2147483647 (2 ³¹ -1)
End value	End value with main counting direction forward.	
	Range of values: 22147483647 (2 ³¹ -1)	
Comparison value	 The count value is compared with the <i>comparison value</i>. See also the parameter "Characteristics of the output": No main counting direction Range of values: -2)³¹ to +2)³¹-1 Main counting direction forward Range of values: -2³¹ to end value-1 Main counting direction backward Range of values: 1 to +2³¹-1 	0
Hysteresis	The <i>hysteresis</i> serves the avoidance of many toggle pro- cesses of the output, if the counter value is in the range of the <i>comparison value</i> . 0, 1: <i>Hysteresis</i> disabled Range of values: 0 to 255	0

Deployment I/O periphery > Counter

Input	Description	Assignment
Signal evaluation	Specify the signal of the connected encoder:	Pulse/direction
	Pulse/direction At the input count and direction signal are connected	
	 At the input there is an encoder connected with the following evaluation: Rotary encoder single Rotary encoder double Rotary encoder quadruple 	
Hardware gate	Gate control exclusively via channel 3:	disabled
	 enabled: The gate control for channel 3 happens via SW and HW gate disabled: The gate control for channel 3 exclusively happens via SW gate 	
	& Chapter 5.6.6.2 'Gate function' on page 119	
Count direction inverted	Invert the input signal 'Direction':	disabled
	enabled: The input signal is inverteddisabled: The input signal is not inverted	

Output	Description	Assignment
Characteristics of the output	The output and the "Comparator" (STS_CMP) status bit are set, dependent on this parameter.	No comparison
	 No comparison: The output is used as normal output and STS_CMP remains reset. Comparator Counter value ≥ Comparison value Counter value ≤ Comparison value Pulse at comparison value To adapt the used actuators you can specify a <i>pulse duration</i>. The output is set for the specified <i>pulse duration</i> when the counter value reaches the <i>comparison value</i>. When you've set a main counting direction the output is only set at reaching the <i>comparison value</i> from the main counting direction. 	
Pulse duration	 Here you can specify the <i>pulse duration</i> for the output signal. The <i>pulse duration</i> starts with the setting of the according digital output. The inaccuracy of the <i>pulse duration</i> is less than 1ms. There is no past triggering of the <i>pulse duration</i> when the <i>comparison value</i> has been left and reached again during pulse output. If the <i>pulse duration</i> is changed during operation, it will take effect with the next pulse. If the <i>pulse duration</i> = 0, the output is set until the comparison condition is not longer fulfilled. Range of values: 0510ms in steps of 2ms 	0

Deployment I/O periphery > Frequency measurement

Frequency	Description		Assignment
Max. counting frequency	Specify the max. frequency for track A/pulse, track B/direction, Latch and HW gate		60kHz
	Frequency	shortest permissible count pulse	
	1kHz	400µs	
	2kHz	200µs	
	5kHz	80µs	
	10kHz	40µs	
	30kHz	13µs	
	60kHz	6.7µs	
	100kHz	4µs	

Hardware interrupt	Description	Assignment
Hardware gate opening	Hardware interrupt by edge 0-1 exclusively at HW gate channel 3	disabled
	 enabled: Process interrupt by edge 0-1 exclusively at HW gate channel 3 with open SW gate disabled: no hardware interrupt 	
Hardware gate closing	Hardware interrupt by edge 1-0 exclusively at HW gate channel 3	disabled
	 enabled: Process interrupt by edge 1-0 exclusively at HW gate channel 3 with open SW gate disabled: no hardware interrupt 	
On reaching comparator	Hardware interrupt on reaching comparator	disabled
	 enabled: Hardware interrupt when comparator is trig- gered, can be configured via 'Characteristics of the output' 	
	disabled: no hardware interrupt	
Overflow	Hardware interrupt overflow	disabled
	 enabled: Hardware interrupt on overflow the upper counter limit disabled: no hardware interrupt 	
Underflow	Hardware interrupt on underrun	disabled
	 enabled: Hardware interrupt on underflow the lower counter limit disabled: no hardware interrupt 	

9.6.6 Frequency measurement

9.6.6.1 Overview

- 4 channels
- Sub module *'Counter'*
- ♦ Chapter 5.7 'Frequency measurement' on page 125

Deployment I/O periphery > Frequency measurement

9.6.6.2 Parametrization in SPEED7 Studio

9.6.6.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
Count	816	DINT	Channel 0: Counter value / Frequency value
	820	DINT	Channel 1: Counter value / Frequency value
	824	DINT	Channel 2: Counter value / Frequency value
	828	DINT	Channel 3: Counter value / Frequency value

Sub module	Output address	Access	Assignment
Count	816	DWORD	reserved
	820	DWORD	reserved
	824	DWORD	reserved
	828	DWORD	reserved

9.6.6.2.2 Basic parameters

Select interrupt

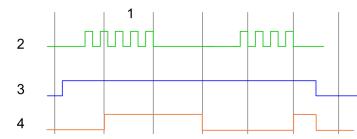

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is disabled.
- Process: The following events of the frequency measurement can trigger a hardware interrupt (selectable via 'Frequency counting'):
 - End of measurement
- Diagnostics+process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

9.6.6.2.3 *'Channel x:'*

Operating mode

Select via 'Channel' the channel and select for frequency measurement via 'Operating mode' the operating mode 'Frequency counting'. Default values and structure of this dialog box depend on the selected 'Operating mode'. The following parameters are supported:

- 1 Integration time
- 2 Counting pulse
- 3 SW gate
- 4 Evaluated frequency

Deployment I/O periphery > Pulse width modulation - PWM

Parameter overview

Operating parameters	Description	Assignment	
Integration time	Specify the integration	100ms	
	Range of values: 10r	ns 10000ms in steps of 1ms	
max. counting frequency	Specify the max. freq	uency for the corresponding input	60kHz
	Frequency	shortest permissible count pulse	
	1kHz	400µs	
	2kHz	200µs	
	5kHz	80µs	
	10kHz	40µs	
	30kHz	13µs	
	60kHz	6.7µs	
	100kHz	4µs	

Hardware interrupt	Description	Assignment
End of measurement	Hardware interrupt at end of measurement	de-activated

9.6.7 Pulse width modulation - PWM

- 9.6.7.1 Overview
- 2 channels
- Sub module 'Counter'
- ♦ Chapter 5.8 'Pulse width modulation PWM' on page 130

9.6.7.2 Parametrization in SPEED7 Studio

	828	DWORD	reserved

9.6.7.2.2 'Channel x'

Operating mode

Select via 'Channel' the channel and select for pulse width modulation via 'Operating mode' the operating mode 'Pulse width modulation'. Default values and structure of this dialog box depend on the selected 'Operating mode'. The following parameters are supported:

- 1 Period
- On-delay
- 2 3 Pulse duration
- 4 Pulse pause

Parameter overview

Operating parameters	Description	Assignment
Output format	 Here specify the range of values for the output. The CPU hereby determines the pulse duration: Per mil Output value is within 0 1000 Pulse duration = (Output value / 1000) x Period S7 Analog value: Output value is Siemens S7 analog value 0 27648 Pulse duration = (Output value / 27648) x Period 	Per mil
Time base	 Here you can set the time base, which will apply for resolution and range of values of the period duration, minimum pulse duration and on-delay. 1ms: The time base is 1ms 0.1ms: The time base is 0.1ms 1µs: The time base is 1µs 	0.1ms
On-delay	Enter here a value for the time to expire from the start of the output sequence to the output of the pulse. The pulse sequence is output at the output channel, on expiration of the on-delay. Range of values: 0 65535 from this there are the fol- lowing effective values: Time base 1ms: 0 65535ms Time base 0.1ms: 0 65535ms Time base 1µs: 0 65535µs	0

Deployment I/O periphery > Pulse Train

Operating parameters	Description	Assignment
Period	With the period you define the length of the output sequence, which consists of pulse duration and pulse pause.	20000
	Range of values:	
	 Time base 1ms: 1 87ms Time base 0.1ms: 0.4 87.0ms Time base 1µs: 1 87µs 	
Minimum pulse duration	With the minimum pulse duration you can suppress short output pulses and short pulse pauses. All pulses or pauses, which are smaller than the minimum pulse dura- tion, are suppressed. This allows you to filter very short pulses (spikes), which can not be recognized by the periphery.	2
	Range of values:	
	 Time base 1ms: 0 Period / 2 · 1ms Time base 0.1ms: 2 Period / 2 · 0.1ms Time base 1µs: 0 Period / 2 · 1µs 	

9.6.8 Pulse Train

SPEED7 Studio - Project transfer > Transfer via MPI

Operating parameters	Description	Assignment
Period	With the period you define the length of the output sequence, which consists of pulse duration and pulse pause. Range of values:	50
	 Time base 1ms: 1 87ms Time base 0.1ms: 0.4 87.0ms Time base 1µs: 1 87µs 	
Minimum pulse duration	With the minimum pulse duration you can suppress short output pulses and short pulse pauses. All pulses or pauses, which are smaller than the minimum pulse dura- tion, are suppressed. This allows you to filter very short pulses (spikes), which can not be recognized by the periphery.	2
	Range of values:	
	 Time base 1ms: 0 Period / 2 · 1ms Time base 0.1ms: 2 Period / 2 · 0.1ms Time base 1µs: 0 Period / 2 · 1µs 	

9.7 SPEED7 Studio - Project transfer

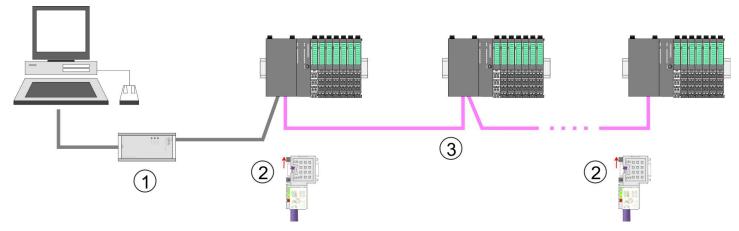

Overview

There are the following possibilities for project transfer into the CPU:

- Transfer via MPI
- Transfer via Ethernet
- Transfer via memory card

9.7.1 Transfer via MPI	
General	For transfer via MPI the CPU has the following interface:
	♦ 'X3: MPI(PtP) interface' on page 42
Net structure	The structure of a MPI net is electrically identical with the structure of a PROFIBUS net. This means the same rules are valid and you use the same components for the build-up. The single participants are connected with each other via bus interface plugs and PROFIBUS cables. Per default the MPI net runs with 187.5kbaud. VIPA CPUs are deliv- ered with MPI address 2.
MPI programming cable	The MPI programming cables are available at VIPA in different variants. The cables pro- vide a RS232 res. USB plug for the PC and a bus enabled RS485 plug for the CPU. Due to the RS485 connection you may plug the MPI programming cables directly to an already plugged plug on the RS485 jack. Every bus participant identifies itself at the bus with an unique address, in the course of the address 0 is reserved for programming devices.
Terminating resistor	A cable has to be terminated with its surge impedance. For this you switch on the termi- nating resistor at the first and the last participant of a network or a segment. Please make sure that the participants with the activated terminating resistors are always power sup- plied. Otherwise it may cause interferences on the bus.

SPEED7 Studio - Project transfer > Transfer via MPI

- 1 MPI programming cable
- 2 Activate the terminating resistor via switch
- 3 MPI network

Proceeding transfer via MPI

- **1.** Connect your PC to the MPI jack of your CPU via a MPI programming cable.
- **2.** Switch-ON the power supply of your CPU and start the SPEED7 Studio with your project.
- 3. Set at 'Active PC interface' the "Serial interface".
- **4.** ▶ Click in the '*Project tree*' to your project and select '*Context menu* → *Recompile*'.
 - \Rightarrow Your project will be translated and prepared for transmission.

Control Control of Con

- 5. ► To transfer the user program and hardware configuration click in the *Project tree* at your CPU and select *'Context menu* → *Transfer all'*.
 - ⇒ A dialog window for project transfer opens
- **6.** Select the 'Port type' "Serial interface" and start the transfer with 'Transfer'.

SPEED7 Studio - Project transfer > Transfer via Ethernet

- 7. Some of the request that the CPU is to be brought into the state STOP.
 - ⇒ The user program and the hardware configuration are transferred via MPI to the CPU.
- 8. Close after transmission the dialog.
- 9. With 'Context menu → Copy RAM to ROM' you can save your project on a memory card, if one is plugged.

9.7.2 Transfer via Ethernet

Proceeding transfer via Ethernet For transfer via Ethernet the CPU has an Ethernet PG/OP channel. For online access to this, you have to assign IP address parameters to this by means of "initialization" and transfer them into your project. For the transfer, connect, if not already done, the Ethernet PG/OP channel jack to your Ethernet. The connection happens via an integrated 2-port switch (X1, X2).

- **1.** Switch-ON the power supply of your CPU and start the SPEED7 Studio with your project.
- 2. Set at 'Active PC interface' the "Ethernet interface".
- 3. ▶ Click in the 'Project tree' to your project and select 'Context menu → Recompile'.
- Active pc interface: Serial interface
 Project tree
 Devices and networking
 PlC...
 PG_OP_Ethernet
 Transfer all
 Transfer all
- **4.** To transfer the user program and hardware configuration click in the *Project tree* at your CPU and select *'Context menu* → *Transfer all'*.
 - ⇒ A dialog window for project transfer opens
- 5. Select the 'Port type' "Ethernet interface" and start the transfer with 'Transfer'.
- 6. Confirm the request that the CPU is to be brought into the state STOP.
 - ⇒ The user program and the hardware configuration are transferred via Ethernet to the CPU.
- **7.** Close after transmission the dialog.

SPEED7 Studio - Project transfer > Transfer via memory card

8. ► With 'Context menu → Copy RAM to ROM' you can save your project on a memory card, if one is plugged.

9.7.3 Transfer via memory card

The memory card serves as external storage medium. There may be stored several proj- ects and sub-directories on a memory card. Please regard that your current project is stored in the root directory and has one of the following file names:
S7PROG.WLDAUTOLOAD.WLD
1. Start the SPEED7 Studio with your project.
2. Click in the 'Project tree' at the CPU.
 3. Create in the SPEED7 Studio with 'Context menu → Export device configuration (WLD)' a wld file.

- ⇒ The wld file is created. This contains the user program and the hardware configuration
- **4.** Copy the wld file at a suited memory card. Plug this into your CPU and start it again.
 - ⇒ The transfer of the application program from the memory card into the CPU takes place depending on the file name after an overall reset or PowerON.

S7PROG.WLD is read from the memory card after overall reset.

AUTOLOAD.WLD is read from the memory card after PowerON.

The blinking of the SD LED of the CPU marks the active transfer. Please regard that your user memory serves for enough space for your user program, otherwise your user program is not completely loaded and the SF LED gets on.

TIA Portal - Work environment > Work environment of the TIA Portal

10 Configuration with TIA Portal

- 10.1 TIA Portal Work environment
- 10.1.1 General

General

In this chapter the project engineering of the VIPA CPU in the Siemens TIA Portal is shown. Here only the basic usage of the Siemens TIA Portal together with a VIPA CPU is shown. Please note that software changes can not always be considered and it may thus be deviations to the description. TIA means Totally integrated Automation from Siemens. Here your VIPA PLCs may be configured and linked. For diagnostics online tools are available.

Information about the Siemens TIA Portal can be found in the online help respectively in the according online documentation.

Starting the TIA Portal

To start the Siemens TIA Portal with Windows select 'Start → Programs → Siemens Automation → TIA ...'

TIA		
Start	 Open existing project Create new project 	Existing projects: Project 1 Project 2
Online & Diagnostics]	Project 3
> Project view		

Exiting the TIA Portal With the menu '*Project* → *Exit*' in the '*Project view*' you may exit the TIA Portal. Here there is the possibility to save changes of your project before.

10.1.2 Work environment of the TIA Portal

Basically, the TIA Portal has the following 2 views. With the button on the left below you can switch between these views:

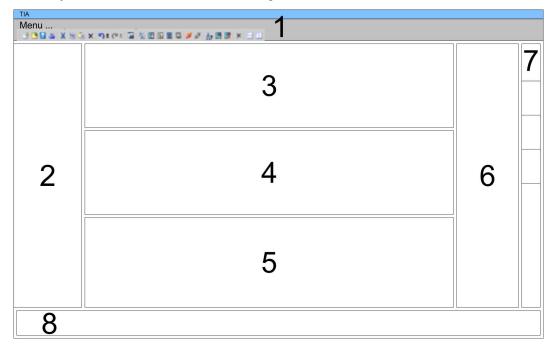

Portal view The '*Portal view*' provides a "task oriented" view of the tools for processing your project. Here you have direct access to the tools for a task. If necessary, a change to the Project view takes place automatically for the selected task.

Project view The '*Project view*' is a "structured" view to all constituent parts of your project.

TIA Portal - Hardware configuration - CPU

Areas of the Project view

The Project view is divided into the following areas:

- 1 Menu bar with toolbars
- 2 Project tree with Details view
- 3 Project area
- 4 Device overview of the project respectively area for block programming
- 5 Properties dialog of a device (parameter) respectively information area
- 6 Hardware catalog and tools
- 7 "Task-Cards" to select hardware catalog, tasks and libraries
- 8 Jump to Portal or Project view

10.2 TIA Portal - Hardware configuration - CPU

Overview

The hardware configuration of the CPU and its plugged modules happens in the Siemens TIA Portal by means of a virtual PROFINET IO device. For the PROFINET interface is standardized software sided, the functionality is guaranteed by including a GSDML file into the Siemens TIA Portal.

The hardware configuration of the CPU is divided into the following parts:

- Installation GSDML SLIO CPU PROFINET
- Configuration Siemens CPU
- Connection SLIO CPU as PROFINET IO device

Installation GSDML SLIO The installation of the PROFINET IO devices 'VIPA SLIO CPU' happens in the hardware catalog with the following approach:

- **1.** Go to the service area of www.vipa.com.
- 2. Load from the download area at 'Config files → PROFINET' the according file for your System SLIO.
- **3.** Extract the file into your working directory.
- **4.** Start the Siemens TIA Portal.
- 5. Close all the projects.
- **6.** Switch to the *Project view*.
- 7. ▶ Select 'Options → Install general station description file (GSD)'.

- 8. Navigate to your working directory and install the according GSDML file.
 - ⇒ After the installation the hardware catalog is refreshed and the Siemens TIA Portal is finished.

After restarting the Siemens TIA Portal the according PROFINET IO device can be found at *Other field devices* > *PROFINET* > *IO* > *VIPA GmbH* > *VIPA SLIO System*.

Thus, the VIPA components can be displayed, you have to deactivate the "Filter" of the hardware catalog.

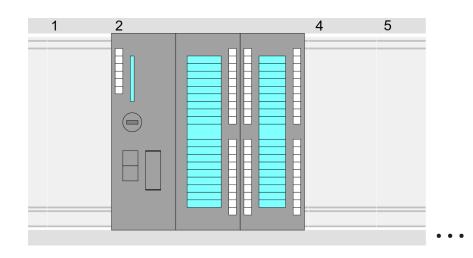

Configuration Siemens CPU

With the Siemens TIA Portal, the CPU from VIPA is to be configured as CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) from Siemens.

- **1.** Start the Siemens TIA Portal.
- 2. Create a new project in the Portal view with 'Create new project'.
- **3.** Switch to the *Project view*.
- **4.** Click in the *Project tree* at 'Add new device'.
- **5.** Select the following CPU in the input dialog:

SIMATIC S7-300 > CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)

 \Rightarrow The CPU is inserted with a profile rail.

Device overview:

Module	 Slot	 Туре	
PLC	2	CPU 314C-2 PN/DP	
MPI interface	2 X1	MPI/DP interface	
PROFINET inter- face	2 X2	PROFINET interface

AI5/AO2	2 6	AI5/AO2	

TIA Portal - Hardware configuration - CPU

Counter	27	Counter	

For parametrization of the digital I/O periphery and the technological functions the corresponding sub modules of the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) is to be used.

 The controlling of the operating modes of the technological functions happens by means of handling blocks of the user program.

Setting standard CPU Since the CPU from VIPA is configured as Siemens CPU, so the setting of the non-VIPA specific parameters takes place via the Siemens CPU. For parametrization click in the *Project area*respectively in the *Device overview* at the CPU part. Then the parameters of the CPU part are shown in the *Properties dialog*. Here you can make your parameter settings. \Leftrightarrow Chapter 4.7 'Setting standard CPU parameters' on page 70

Connection SLIO CPU as PROFINET IO device

- **1.** Switch in the *Project area* to *'Network view'*.
- 2. After installing the GSDML the IO device for the SLIO CPU may be found in the hardware catalog at *Other field devices > PROFINET > IO > VIPA GmbH > VIPA SLIO System*. Connect the slave system to the CPU by dragging&dropping it from the hardware catalog to the *Network view* and connecting it via PROFINET to the CPU.
- 3. Click in the *Network view* at the PROFINET part of the Siemens CPU and enter at valid IP address data in '*Properties*' at '*Ethernet address*' in the area '*IP protocol*'.
- **4.** Enter at *'PROFINET'* a *'PROFINET device name'*. The device name must be unique at the Ethernet subnet.

TIA Portal - Hardware configuration - Ethernet PG/OP channel

Network view	Catalog
PLC CPU 314C-2PN PROFINET IO System	C Filter
CPU 314C-2PN//P General Ethernet Addresses Properties Ethernet addresses IIP Protocol IP address: Subnet mask: PROFINET PROFINET device name:	- VIPA SLIO System Head module CPU
	e <i>'VIPA SLIO CPU'</i> and switch to the FINET IO device <i>'VIPA SLIO CPU</i> ' the CPL ot 1 you can place your System SLIO

Setting VIPA specific CPU parameters For parametrization click at the CPU at slot 0 in the *Device overview* of the PROFINET IO device 'VIPA SLIO CPU'. Then the parameters of the CPU part are shown in the *Properties dialog*. Here you can make your parameter settings. Schapter 4.8 'Setting VIPA specific CPU parameters' on page 74

10.3 TIA Portal - Hardware configuration - Ethernet PG/OP channel

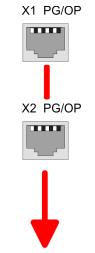

Overview	The CPU has an integrated Ethernet PG/OP channel. This channel allows you to pro- gram and remote control your CPU.					
	The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2.					
	The Ethernet PG/OP channel also gives you access to the internal web page th contains information about firmware version, connected I/O devices, current cyc times etc.					
	 At the first commissioning respectively after a factory reset the Ethernet PG/OP channel has no IP address. 					
	For online access to the CPU via the Ethernet PG/OP channel, valid IP address parameters have to be assigned to this. This is called "initialization".					
	This can be done with the Siemens TIA Portal.					
Assembly and commis-	1. Install your System SLIO with your CPU.					
sioning	2. Wire the system by connecting cables for voltage supply and signals.					
	3. Connect the one of the Ethernet jacks (X1, X2) of the Ethernet PG/OP channel to Ethernet.					

TIA Portal - Hardware configuration - Ethernet PG/OP channel

- **4.** Switch on the power supply.
 - After a short boot time the CP is ready for communication. He possibly has no IP address data and requires an initialization.

"Initialization" via Online functions

- The initialization via the Online functions takes place with the following proceeding:
 - Determine the current Ethernet (MAC) address of your Ethernet PG/OP channel. This can be found at the front of the CPU labelled as "MAC PG/OP: ...".

MAC PG/OP: 00-20-D5-77-05-10

Assign IP address parameters from your system administrator. The assignment of the IP address data happens online in the Siemens TIA Portal with the following proceeding:

- **1.** Start the Siemens TIA Portal.
- 2. Switch to the 'Project view'.
- 3. Click in the 'Project tree' at 'Online access' and choose here by a doubleclick your network card, which is connected to the Ethernet PG/OP channel.
- **4.** To get the stations and their MAC address, use the 'Accessible device'. This can be found at the front of the CPU labelled as "MAC PG/OP: ...".
- 5. Choose from the list the module with the known MAC address (Onboard PG/OP [MAC address]) and open with "Online & Diagnostics" the diagnostics dialog in the Project area.
- **6.** Navigate to *Functions > Assign IP address*. Type in the IP configuration like IP address, subnet mask and gateway.

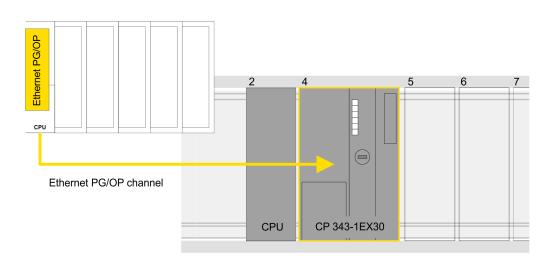

TIA Portal - Hardware configuration - Ethernet PG/OP channel

- 7. Confirm with [Assign IP configuration].
 - ⇒ Directly after the assignment the Ethernet PG/OP channel is online reachable using the set IP address data. The value remains as long as it is reassigned, it is overwritten by a hardware configuration or an factory reset is executed.

Project tree	Online access	Assign IP address			
Online access Net adapter accessible devices Onboard PG/OP [00-2 Online & Diagnostics	Diagnostics General Functions Assign IP address Assign name Reset to factory set	IP address: 0 .0 .0 .0 Subnet mask: 0 .0 .0 .0 Router address: 0 .0 .0 .0			
		Assign IP address			

Due to the system you may get a message that the IP address could not be assigned. This message can be ignored.

- Take IP address parameters in project
- **1.** Open your project.
- **2.** If not already done, configure in the *'Device configuration'* a Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
- 3. As Ethernet PG/OP channel place at slot 4 the Siemens CP 343-1 (6GK7 343-1EX30 0XE0 V3.0).
- **4.** Open the "Property" dialog by clicking on the CP 343-1EX30 and enter for the CP at "Properties" at "Ethernet address" the IP address data, which you have assigned before.
- 5. Transfer your project.

10.4 TIA Portal - VIPA-Include library

	-
Overview	 The VIPA specific blocks can be found in the "Service" area of www.vipa.com as library download file at <i>Downloads</i> > <i>VIPA LIB</i>. The library is available as packed zip file for the corresponding TIA Portal version. As soon as you want to use VIPA specific blocks you have to import them into your project. Execute the following steps: Load an unzip the fileTIA_Vxx.zip (note TIA Portal version) Open library and transfer blocks into the project
UnzipTIA_Vxx.zip	Start your un-zip application with a double click on the file TIA_Vxx.zip and copy all the files and folders in a work directory for the Siemens TIA Portal.
Open library and transfer blocks into the project	 Start the Siemens TIA Portal with your project. Switch to the <i>Project view</i>. Choose "Libraries" from the task cards on the right side. Click at "Global libraries". Click at "Open global libraries".

TIA Portal - Project transfer > Transfer via Ethernet

6. Navigate to your directory and load the file ... TIA.alxx.

7. Copy the necessary blocks from the library into the "Program blocks" of the *Project tree* of your project. Now you have access to the VIPA specific blocks via your user application.

10.5 TIA Portal - Project transfer

Overview

There are the following possibilities for project transfer into the CPU:

- Transfer via MPI
- Transfer via Ethernet
- Transfer via memory card

10.5.1 Transfer via MPI

Transfer via MPI

Currently the VIPA programming cables for transfer via MPI are not supported. This is only possible with the programming cable from Siemens.

- **1.** Establish a connection to the CPU via MPI with an appropriate programming cable. Information may be found in the corresponding documentation of the programming cable.
- **2.** Switch-ON the power supply of your CPU and start the Siemens TIA Portal with your project.
- Select in the Project tree your CPU and choose 'Context menu
 → Download to device → Hardware configuration' to transfer the hardware configuration.
- 4. To transfer the PLC program choose 'Context menu → Download to device
 → Software'. Due to the system you have to transfer hardware configuration and PLC program separately.

10.5.2 Transfer via Ethernet

For transfer via Ethernet the CPU has the following interface:

■ X1/X2: Ethernet PG/OP channel

TIA Portal - Project transfer > Transfer via memory card

Transfer

- **1.** For the transfer, connect, if not already done, the appropriate Ethernet jack to your Ethernet.
 - 2. Open your project with the Siemens TIA Portal.
 - **3.** Click in the *Project tree* at *Online access* and choose here by a double-click your network card, which is connected to the Ethernet PG/OP interface.
 - 4. Select in the *Project tree* your CPU and click at [Go online].
 - 5. Set the access path by selecting "PN/IE" as type of interface, your network card and the according subnet. Then a net scan is established and the corresponding station is listed.
 - 6. Establish with [Connect] a connection.
 - 7. ▶ Click to 'Online → Download to device'.
 - ⇒ The according block is compiled and by a request transferred to the target device. Provided that no new hardware configuration is transferred to the CPU, the entered Ethernet connection is permanently stored in the project as transfer channel.

10.5.3 Transfer via memory card

Proceeding

The memory card serves as external storage medium. There may be stored several projects and sub-directories on a memory card. Please regard that your current project is stored in the root directory and has one of the following file names:

- S7PROG.WLD
- AUTOLOAD.WLD
- **1.** Start the Siemens TIA Portal with your project.
- 2. ▶ Create a wld file with 'Project → Memory card file → New'.
 - ⇒ The wld file is shown in the *Project tree* at "SIMATIC Card Reader" as "Memory card file".
- **3.** Copy the blocks from the *Program blocks* to the wld file. Here the hardware configuration data are automatically copied to the wld file as "System data".
- **4.** Copy the wld file at a suited memory card. Plug this into your CPU and start it again.
 - ⇒ The transfer of the application program from the memory card into the CPU takes place depending on the file name after an overall reset or PowerON.

S7PROG.WLD is read from the memory card after overall reset.

AUTOLOAD.WLD is read from the memory card after PowerON.

The blinking of the SD LED of the CPU marks the active transfer. Please regard that your user memory serves for enough space for your user program, otherwise your user program is not completely loaded and the SF LED gets on.

Appendix

Content

- A System specific event IDs
- B Integrated blocks
- C SSL partial list

A System specific event IDs

Event IDs

♦ Chapter 4.19 'Diagnostic entries' on page 94

Event ID	Description
0x115C	Vendor-specific interrupt (OB 57) at EtherCAT
	OB : OB number
	ZINFO1 : Logical address of the slave that triggered the interrupt
	ZINFO2 : Interrupt type
	0: Reserved
	1: Diagnostic interrupt (incoming)
	2: Hardware interrupt
	3: Pull interrupt
	4: Plug interrupt
	5: Status interrupt
	6: Update interrupt
	7: Redundancy interrupt
	8: Controlled by the supervisor
	9: Enabled
	10: Wrong sub module plugged
	11: Restoration of the sub module
	12: Diagnostic interrupt (outgoing)
	13: Cross traffic connection message
	14: Neighbourhood change message
	15: Synchronisation message (bus)
	16: Synchronisation message (device)
	17: Network component message
	18: Clock synchronisation message (bus)
	31: Pull interrupt module
	32: Vendor specific interrupt min.
	33: Vendor specific interrupt topology change
	127: Vendor specific interrupt max.
	ZINFO3 : CoE error code
0xE003	Error on accessing the periphery
	ZINFO1 : Transfer type
	ZINFO2 : Periphery address
	ZINFO3 : Slot
0xE004	Multiple configuration of a periphery address
	ZINFO1 : Periphery address
	ZINFO2 : Slot

Event ID	Description
0xE005	Internal error - Please contact the our hotline!
	ZINFO1 : Not relevant to the user
	ZINFO2 : Not relevant to the user
	ZINFO3 : Not relevant to the user
0xE007	Configured in-/output bytes do not fit into periphery area
0xE008	Internal error - Please contact the our hotline!
0xE009	Error on accessing the standard backplane bus
0xE010	There is a undefined module at the backplane bus
	ZINFO2 : Slot
	ZINFO3 : Type ID
0xE011	Master project engineering at slave CPU not possible or wrong slave configuration
0xE012	Error at parametrization
0xE013	Error at shift register access to standard bus digital modules
0xE014	Error at Check_Sys
0xE015	Error at access to the master
	ZINFO2 : Slot of the master
	ZINFO2 : Page frame master
0xE016	Maximum block size at master transfer exceeded
	ZINFO1 : Periphery address
	ZINFO2 : Slot
0xE017	Error at access to integrated slave
0xE018	Error at mapping of the master periphery
0xE019	Error at standard back plane bus system recognition
0xE01A	Error at recognition of the operating mode (8 / 9 bit)
0xE01B	Error - maximum number of plug-in modules exceeded
0xE020	Fehler - Alarminformationen undefiniert
	ZINFO2 : Slot
	ZINFO3 : Not relevant to the user
	DatID : Interrupt type
0xE030	Error of the standard bus
0xE033	Internal error - Please contact the our hotline!
0xE0B0	SPEED7 is not stoppable (e.g. undefined BCD value at timer)
	ZINFO1 : Not relevant to the user
	ZINFO2 : Not relevant to the user
	ZINFO3 : Not relevant to the user
	DatID : Not relevant to the user
0xE0C0	Not enough space in work memory for storing code block (block size exceeded)
0xE0CB	Error at SSL access

Event ID	Description
	ZINFO1 : Error
	4: SSL wrong
	5: Sub-SSL wrong
	6: Index wrong
	ZINFO2 : SSL ID
	ZINFO3 : Index
0xE0CC	Communication errors
	ZINFO1 : Error code
	1: Wrong priority
	2: Buffer overflow
	3: Telegram format error
	4: Wrong SSL request (SSL ID not valid)
	5: Wrong SSL request (SSL sub ID invalid)
	6: Wrong SSL request (SSL-Index not valid)
	7: Wrong value
	8: Wrong return value
	9: Wrong SAP
	10: Wrong connection type
	11: Wrong sequence number
	12: Faulty block number in the telegram
	13: Faulty block type in the telegram
	14: Inactive function
	15: Wrong size in the telegram
	20: Error in writing on MMC
	90: Faulty buffer size
	98: Unknown error
	99: Internal error
0xE0CD	Error at DP-V1 job management
	ZINFO1 : Not relevant to the user
	ZINFO2 : Not relevant to the user
	ZINFO3 : Not relevant to the user
	DatID : Not relevant to the user
0xE0CE	Error: Timeout at sending of the i-slave diagnostics
0xE100	Memory card access error
0xE101	Memory card error file system
0xE102	Memory card error FAT
0xE104	Memory card error at saving
	ZINFO3 : Not relevant to the user

Event ID	Description
0xE200	Memory card writing finished (Copy Ram2Rom)
	OB : Not relevant to the user
	PK : Not relevant to the user
0xE210	Memory card reading finished (reload after overall reset)
	OB : Not relevant to the user
	PK : Not relevant to the user
	ZINFO1 : Not relevant to the user
0xE21E	Memory card reading: Error at reload (after overall reset), error in block header
	ZINFO1 : Block type
	56: OB
	65: DB
	66: SDB
	67: FC
	68: SFC
	69: FB
	70: SFB
	97: VDB
	98: VSDB
	99: VFC
	100: VSFC
	101: VFB
	102: VSFB
	111: VOB
	ZINFO2 : Block number
	ZINFO3 : Block length
0xE21E	Memory card reading: Error at reload (after overall reset), file "Protect.wld" too big
	OB : Not relevant to the user
0xE21F	Memory card reading: Error at reload (after overall reset), checksum error at reading
	OB : Not relevant to the user
	PK : Not relevant to the user
	ZINFO1 : Not relevant to the user
	ZINFO2 : BstTyp
	56: OB
	65: DB
	66: SDB
	67: FC
	68: SFC
	69: FB

Event ID	Description
	70: SFB
	97: VDB
	98: VSDB
	99: VFC
	100: VSFC
	101: VFB
	102: VSFB
	111: VOB
	ZINFO3 : BstNr
0xE300	Internal flash writing finished (Copy Ram2Rom)
0xE310	Internal flash writing finished (reload after battery failure)
0xE400	FSC card was plugged
	OB : FSC is activated by this slot(PK)
	OB : The inserted FSC is the activated FSC
	OB : The inserted FSC is compatible to the CPU
	PK : FSC source
	0: CPU
	1: Card
	ZINFO1 : FSC(CRC)
	1146: 955-C000070

	253: Process image enabled in STOP
	254: Watchdog

Event ID	Description
	255: Not set
	PK : Not relevant to the user
	ZINFO1 : Station address of the EtherCAT device
	ZINFO2 : Errorcode
	1: WARNING: For the drive the DC Beckhoff mode is recommended (DC reference clock is not in Beckhoff Mode)
	2: NOTE: For the drive the DC Beckhoff mode is recommended (DC reference clock is not in Beckhoff Mode)
	3: The station address could not be determined for checking (station address in Zinfo1 is accordingly 0)
	4: The slave information could not be determined for checking (station address in Zinfo1 is accordingly 0)
	5: The EtherCAT status of the drive could not be determined
	6: Error when sending the SDO request (for further information, the (subsequent) event with the ID 0xED60 is to be analysed on the CP)
	7: Drive returns error in the SDO response (for further information, the (subsequent) event with the ID 0xED60 is to be analysed on the CP)
	8: SDO timeout, DC mode could not be determined (for further information, the (subsequent) event with the ID 0xED60 is to be analysed on the CP)
	ZINFO3 : Not relevant to the user
	DatID : Not relevant to the user

B Integrated blocks

More information about this may be found in the manual "SPEED7 Operation List" from VIPA.

ОВ	Name	Description
OB 1	CYCL_EXC	Program Cycle
OB 10	TOD_INT0	Time-of-day Interrupt
OB 20	DEL_INT0	Time delay interrupt
OB 21	DEL_INT1	Time delay interrupt
OB 32	CYC_INT2	Cyclic interrupt
OB 33	CYC_INT3	Cyclic interrupt
OB 34	CYC_INT4	Cyclic interrupt
OB 35	CYC_INT5	Cyclic interrupt
OB 40	HW_INT0	Hardware interrupt
OB 80	CYCL_FLT	Time error
OB 81	PS_FLT	Power supply error
OB 82	I/O_FLT1	Diagnostics interrupt
OB 83	I/O_FLT2	Insert / remove module
OB 85	OBNL_FLT	Priority class error
OB 86	RACK_FLT	Slave failure / restart
OB 100	COMPLETE RESTART	Start-up
OB 102	COLD RESTART	Start-up
OB 121	PROG_ERR	Programming error
OB 122	MOD_ERR	Periphery access error
SFB	Name	Description
SFB 0	CTU	Up-counter
SFB 1	CTD	Down-counter
SFB 2	CTUD	Up-down counter
SFB 3	TP	Create pulse
SFB 4	TON	On-delay
SFB 5	TOF	Create turn-off delay
SFB 7	TIMEMESS	Time measurement
SFB 12	BSEND	Sending data in blocks
SFB 13	BRCV	Receiving data in blocks:
SFB 14	GET	Remote CPU read

SFB	Name	Description
SFB 15	PUT	Remote CPU write
SFB 32	DRUM	Realize a step-by-step switch
SFB 47	COUNT	Control counter
SFB 48	FREQUENC	Frequency measurement
SFB 49	PULSE	Pulse width modulation
SFB 52	RDREC	Read record set
SFB 53	WRREC	Write record set
SFB 54	RALRM	Receiving an interrupt from a periphery module
SFC	Name	Description
SFC 0	SET_CLK	Set system clock
SFC 1	READ_CLK	Read system clock
SFC 2	SET_RTM	Set run-time meter
SFC 3	CTRL_RTM	Control run-time meter
SFC 4	READ_RTM	Read run-time meter
SFC 5	_ GADR_LGC	Logical address of a channel
SFC 6	RD_SINFO	Read start information
SFC 7	_ DP_PRAL	Triggering a hardware interrupt on the DP master
SFC 12	D_ACT_DP	Activating and deactivating of DP slaves
SFC 13	DPNRM_DG	Read diagnostic data of a DP salve
SFC 14	DPRD_DAT	Read consistent data
SFC 15	DPWR_DAT	Write consistent data
SFC 17	ALARM_SQ	ALARM_SQ
SFC 18	ALARM_SQ	ALARM_S
SFC 19	ALARM_SC	Acknowledgement state last alarm
SFC 20	BLKMOV	Block move
SFC 21	FILL	Fill a field
SFC 22	CREAT_DB	Create a data block
SFC 23	DEL_DB	Deleting a data block
SFC 24	TEST_DB	Test data block
SFC 28	SET_TINT	Set time-of-day interrupt
SFC 29	CAN_TINT	Cancel time-of-day interrupt
SFC 30	ACT_TINT	Activate time-of-day interrupt
SFC 31	QRY_TINT	Query time-of-day interrupt
SFC 32	SRT_DINT	Start time-delay interrupt
SFC 33	CAN_DINT	Cancel time-delay interrupt
SFC 34	QRY_DINT	Query time-delay interrupt

SFC	Name	Description
SFC 36	MSK_FLT	Mask synchronous errors
SFC 37	MSK_FLT	Unmask synchronous errors
SFC 38	READ_ERR	Read error register
SFC 39	DIS_IRT	Disabling interrupts
SFC 40	EN_IRT	Enabling interrupts
SFC 41	DIS_AIRT	Delaying interrupts
SFC 42	EN_AIRT	Enabling delayed interrupts
SFC 43	RE_TRIGR	Re-trigger the watchdog
SFC 44	REPL_VAL	Replace value to ACCU1
SFC 46	STP	STOP the CPU
SFC 47	WAIT	Delay the application program
SFC 49	LGC_GADR	Read the slot address
SFC 51	RDSYSST	Read system status list SSL
SFC 52	WR_USMSG	Write user entry into diagnostic buffer
SFC 53	μS_TICK	Time measurement
SFC 54	RD_DPARM	Reading predefined parameters
SFC 55	WR_PARM	Write dynamic parameter
SFC 56	WR_DPARM	Write default parameter
SFC 57	PARM_MOD	Parametrize module
SFC 58	WR_REC	Write record set
SFC 59	RD_REC	Read record set
SFC 64	TIME_TCK	Read system time tick
SFC 65	X_SEND	Sending data
SFC 66	X_RCV	Receiving data
SFC 67	X_GET	Read data
SFC 68	X_PUT	Write data
SFC 69	X_ABORT	Disconnect
SFC 70	GEO_LOG	Determining the start address of a module
SFC 71	LOG_GEO	Determining the slot belonging to a logical address
SFC 81	UBLKMOV	Copy data area without gaps
SFC 101	HTL_RTM	Handling runtime meters
SFC 102	RD_DPARA	Reading predefined parameters
SFC 105	READ_SI	Reading dynamic system resources
SFC 106	DEL_SI	Releasing dynamic system resources
SFC 107	ALARM_DQ	ALARM_DQ
SFC 108	ALARM_DQ	ALARM_DQ

C SSL partial list

More information about this may be found in the manual "SPEED7 Operation List" from VIPA.

SSL-ID	SSL partial list
xy11h	Module identification
xy12h	CPU characteristics
xy13h	User memory areas
xy14h	System areas
xy15h	Block Types
xy19h	Status of all LEDs
xy1Ch	Identification of the component
xy22h	Interrupt status
xy32h	Communication status data
xy37h	Ethernet details of the module
xy3Ah	Status of the TCON Connections
xy74h	Status of the LEDs
xy91h	Status information CPU
xy92h	Stations status information (DPM)
xy94h	Stations status information (DPM, PROFINET-IO and EtherCAT)
xy96h	Module status information (PROFIBUS DP, PROFINET-IO, EtherCAT)
xyA0h	Diagnostic buffer of the CPU
xyB3h	Module diagnostic information (record set 1) via logical address
xyB4h	Diagnostic data of a DP slave
xyE0h	Information EtherCAT master/slave
xyE1h	EtherCAT bus system
xyFAh	Statistics information to OBs
xyFCh	Status of the VSC features from the System SLIO CPU
